New Foreword

On October 1, 2001 Axiom was withdrawn from the market and ended life as a commercial product. On September 3, 2002 Axiom was released under the Modified BSD license, including this document. On August 27, 2003 Axiom was released as free and open source software available for download from the Free Software Foundation's website, Savannah.

Work on Axiom has had the generous support of the Center for Algorithms and Interactive Scientific Computation (CAISS) at City College of New York. Special thanks go to Dr. Gilbert Baumslag for his support of the long term goal.

The online version of this documentation is roughly 1000 pages. In order to make printed versions we've broken it up into three volumes. The first volume is tutorial in nature. The second volume is for programmers. The third volume is reference material. We've also added a fourth volume for developers. All of these changes represent an experiment in print-on-demand delivery of documentation. Time will tell whether the experiment succeeded.

Axiom has been in existence for over thirty years. It is estimated to contain about three hundred man-years of research and has, as of September 3, 2003, 143 people listed in the credits. All of these people have contributed directly or indirectly to making Axiom available. Axiom is being passed to the next generation. I'm looking forward to future milestones.

With that in mind I've introduced the theme of the "30 year horizon". We must invent the tools that support the Computational Mathematician working 30 years from now. How will research be done when every bit of mathematical knowledge is online and instantly available? What happens when we scale Axiom by a factor of 100, giving us 1.1 million domains? How can we integrate theory with code? How will we integrate theorems and proofs of the mathematics with space-time complexity proofs and running code? What visualization tools are needed? How do we support the conceptual structures and semantics of mathematics in effective ways? How do we support results from the sciences? How do we teach the next generation to be effective Computational Mathematicians?

The "30 year horizon" is much nearer than it appears.

Tim Daly
CAISS, City College of New York
November 10, 2003 ((iHy))

Chapter 1

Chapter Overview

This book contains the packages in Axiom, in alphabetical order.

Each package has an associated 'dotpic' chunk which only lists the packages, categories, and packages that are in the layer immediately below in the build order. For the full list see the algebra Makefile where this information is maintained.

Each package is preceded by a picture. The picture indicates several things. The colors indicate whether the name refers to a category, package, or package. An ellipse means that the name refers to something in the bootstrap set. Thus,

— package ALGMANIP AlgebraicManipulations —

```

)abbrev package ALGMANIP AlgebraicManipulations
++ Author: Manuel Bronstein
++ Date Created: 28 Mar 1988
++ Date Last Updated: 5 August 1993
++ Description:
++ AlgebraicManipulations provides functions to simplify and expand
++ expressions involving algebraic operators.

AlgebraicManipulations(R, F) : SIG == CODE where
  R : IntegralDomain
  F : Join(Field, ExpressionSpace) with
    numer : $ -> SparseMultivariatePolynomial(R, Kernel $)
    ++ numer(x) \undocumented
    denom : $ -> SparseMultivariatePolynomial(R, Kernel $)
    ++ denom(x) \undocumented
    coerce : SparseMultivariatePolynomial(R, Kernel $) -> $
    ++ coerce(x) \undocumented

  N ==> NonNegativeInteger
  Z ==> Integer
  OP ==> BasicOperator
  SY ==> Symbol
  K ==> Kernel F
  P ==> SparseMultivariatePolynomial(R, K)
  RF ==> Fraction P
  REC ==> Record(ker:List K, exponent: List Z)
  ALGOP ==> "%alg"
  NTHR ==> "nthRoot"

  SIG ==> with

    rootSplit : F -> F
    ++ rootSplit(f) transforms every radical of the form
    ++ \spad{(a/b)**(1/n)} appearing in f into \spad{a**(1/n) / b**(1/n)}.
    ++ This transformation is not in general valid for all
    ++ complex numbers \spad{a} and b.

    ratDenom : F -> F
    ++ ratDenom(f) rationalizes the denominators appearing in f
    ++ by moving all the algebraic quantities into the numerators.

    ratDenom : (F, F) -> F
    ++ ratDenom(f, a) removes \spad{a} from the denominators in f
    ++ if \spad{a} is an algebraic kernel.

    ratDenom : (F, List F) -> F
    ++ ratDenom(f, [a1,...,an]) removes the ai's which are
    ++ algebraic kernels from the denominators in f.

    ratDenom : (F, List K) -> F

```

```

++ ratDenom(f, [a1,...,an]) removes the ai's which are
++ algebraic from the denominators in f.

ratPoly : F -> SparseUnivariatePolynomial F
++ ratPoly(f) returns a polynomial p such that p has no
++ algebraic coefficients, and \spad{p(f) = 0}.

if R has Join(OrderedSet, GcdDomain, RetractableTo Integer)
and F has FunctionSpace(R) then

rootPower : F -> F
++ rootPower(f) transforms every radical power of the form
++ \spad{(a**(1/n))**m} into a simpler form if \spad{m} and
++ \spad{n} have a common factor.

rootProduct : F -> F
++ rootProduct(f) combines every product of the form
++ \spad{(a**(1/n))**m * (a**(1/s))**t} into a single power
++ of a root of \spad{a}, and transforms every radical power
++ of the form \spad{(a**(1/n))**m} into a simpler form.

rootSimp : F -> F
++ rootSimp(f) transforms every radical of the form
++ \spad{(a * b**(q*n+r))**(1/n)} appearing in f into
++ \spad{b**q * (a * b**r)**(1/n)}.
++ This transformation is not in general valid for all
++ complex numbers b.

rootKerSimp : (OP, F, N) -> F
++ rootKerSimp(op,f,n) should be local but conditional.

basisOfCommutingElements : () -> List A
++ basisOfCommutingElements() returns a basis of the space of
++ all x of \spad{A} satisfying \spad{0 = commutator(x,a)} for all
++ \spad{a} in \spad{A}.

basisOfLeftAnnihilator : A -> List A
++ basisOfLeftAnnihilator(a) returns a basis of the space of
++ all x of \spad{A} satisfying \spad{0 = x*a}.

basisOfRightAnnihilator : A -> List A
++ basisOfRightAnnihilator(a) returns a basis of the space of
++ all x of \spad{A} satisfying \spad{0 = a*x}.

basisOfLeftNucleus : () -> List A
++ basisOfLeftNucleus() returns a basis of the space of
++ all x of \spad{A} satisfying \spad{0 = associator(x,a,b)}
++ for all \spad{a},b in \spad{A}.

basisOfRightNucleus : () -> List A
++ basisOfRightNucleus() returns a basis of the space of
++ all x of \spad{A} satisfying \spad{0 = associator(a,b,x)}
++ for all \spad{a},b in \spad{A}.

basisOfMiddleNucleus : () -> List A
++ basisOfMiddleNucleus() returns a basis of the space of
++ all x of \spad{A} satisfying \spad{0 = associator(a,x,b)}
++ for all \spad{a},b in \spad{A}.

basisOfNucleus : () -> List A
++ basisOfNucleus() returns a basis of the space of
++ all x of \spad{A} satisfying
++ \spad{associator(x,a,b) = associator(a,x,b) = associator(a,b,x) = 0}
++ for all \spad{a},b in \spad{A}.

basisOfCenter : () -> List A
++ basisOfCenter() returns a basis of the space of
++ all x of \spad{A} satisfying \spad{commutator(x,a) = 0} and
++ \spad{associator(x,a,b) = associator(a,x,b) = associator(a,b,x) = 0}
++ for all \spad{a},b in \spad{A}.

basisOfLeftNucloid : ()-> List Matrix R
++ basisOfLeftNucloid() returns a basis of the space of
++ endomorphisms of \spad{A} as right module.
++ Note that left nucloid coincides with left nucleus
++ if \spad{A} has a unit.

basisOfRightNucloid : ()-> List Matrix R

```

```

++ basisOfRightNucloid() returns a basis of the space of
++ endomorphisms of \spad{A} as left module.
++ Note that right nucloid coincides with right nucleus
++ if \spad{A} has a unit.

basisOfCentroid : ()-> List Matrix R
++ basisOfCentroid() returns a basis of the centroid, the
++ endomorphism ring of \spad{A} considered as \spad{(A,A)}-bimodule.

radicalOfLeftTraceForm : () -> List A
++ radicalOfLeftTraceForm() returns basis for null space of
++ \spad{leftTraceMatrix()}, if the algebra is
++ associative, alternative or a Jordan algebra, then this
++ space equals the radical (maximal nil ideal) of the algebra.

if R has EuclideanDomain then

    basis : V A -> V A
        ++ basis(va) selects a basis from the elements of va.

integrate : (EF,SOCF,F,F,RT) -> Result
++ integrate(exp, a..b, epsrel, routines) is a top level ANNA function
++ to integrate an expression, {\tt exp}, over a given range {\tt a}
++ to {\tt b} to the required absolute and relative accuracy using
++ the routines available in the RoutinesTable provided.
++
++ It iterates over the \axiom{domains} of
++ \axiomType{NumericalIntegrationCategory}
++ to get the name and other
++ relevant information of the the (domain of the) numerical
++ routine likely to be the most appropriate,
++ have the best \axiom{measure}.
++
++ It then performs the integration of the given expression
++ on that \axiom{domain}.

```

```

integrate : NumericalIntegrationProblem -> Result
++ integrate(IntegrationProblem) is a top level ANNA function
++ to integrate an expression over a given range or ranges
++ to the required absolute and relative accuracy.
++
++ It iterates over the \axiom{domains} of
++ \axiomType{NumericalIntegrationCategory} to get the name and other
++ relevant information of the the (domain of the) numerical
++ routine likely to be the most appropriate,
++ have the best \axiom{measure}.
++
++ It then performs the integration of the given expression
++ on that \axiom{domain}.

```

```

integrate : (EF,SOCF,F,F) -> Result
++ integrate(exp, a..b, epsabs, epsrel) is a top level ANNA function
++ to integrate an expression, {\tt exp}, over a given range {\tt a}
++ to {\tt b} to the required absolute and relative accuracy.
++
++ It iterates over the \axiom{domains} of
++ \axiomType{NumericalIntegrationCategory} to get the name and other
++ relevant information of the the (domain of the) numerical
++ routine likely to be the most appropriate,
++ have the best \axiom{measure}.
++
++ It then performs the integration of the given expression
++ on that \axiom{domain}.

```

```

integrate : (EF,SOCF,F) -> Result
++ integrate(exp, a..b, epsrel) is a top level ANNA
++ function to integrate an expression, {\tt exp}, over a given
++ range {\tt a} to {\tt b} to the required relative accuracy.
++
++ It iterates over the \axiom{domains} of
++ \axiomType{NumericalIntegrationCategory} to get the name and other
++ relevant information of the the (domain of the) numerical
++ routine likely to be the most appropriate,
++ have the best \axiom{measure}.
++
++ It then performs the integration of the given expression
++ on that \axiom{domain}.
++
++ If epsrel = 0, a default absolute accuracy is used.

integrate : (EF,SOCF) -> Result
++ integrate(exp, a..b) is a top
++ level ANNA function to integrate an expression, {\tt exp},
++ over a given range {\tt a} to {\tt b}.
++
++ It iterates over the \axiom{domains} of
++ \axiomType{NumericalIntegrationCategory} to get the name and other
++ relevant information of the the (domain of the) numerical
++ routine likely to be the most appropriate,
++ have the best \axiom{measure}.
++
++ It then performs the integration of the given expression
++ on that \axiom{domain}.
++
++ Default values for the absolute and relative error are used.

integrate : (EF,LSOCF) -> Result
++ integrate(exp, [a..b,c..d,...]) is a top
++ level ANNA function to integrate a multivariate expression, {\tt exp},
++ over a given set of ranges.
++
++ It iterates over the \axiom{domains} of
++ \axiomType{NumericalIntegrationCategory} to get the name and other
++ relevant information of the the (domain of the) numerical
++ routine likely to be the most appropriate,
++ have the best \axiom{measure}.
++
++ It then performs the integration of the given expression
++ on that \axiom{domain}.
++
++ Default values for the absolute and relative error are used.

integrate : (EF,LSOCF,F) -> Result

```

```

++ integrate(exp, [a..b,c..d,...], epsrel) is a top
++ level ANNA function to integrate a multivariate expression, {\tt exp},
++ over a given set of ranges to the required relative
++ accuracy.
++
++ It iterates over the \axiom{domains} of
++ \axiomType{NumericalIntegrationCategory} to get the name and other
++ relevant information of the the (domain of the) numerical
++ routine likely to be the most appropriate,
++ have the best \axiom{measure}.
++
++ It then performs the integration of the given expression
++ on that \axiom{domain}.
++
++ If epsrel = 0, a default absolute accuracy is used.

integrate : (EF,LSOCF,F,F) -> Result
++ integrate(exp, [a..b,c..d,...], epsabs, epsrel) is a top
++ level ANNA function to integrate a multivariate expression, {\tt exp},
++ over a given set of ranges to the required absolute and relative
++ accuracy.
++
++ It iterates over the \axiom{domains} of
++ \axiomType{NumericalIntegrationCategory} to get the name and other
++ relevant information of the the (domain of the) numerical
++ routine likely to be the most appropriate,
++ have the best \axiom{measure}.
++
++ It then performs the integration of the given expression
++ on that \axiom{domain}.

integrate : (EF,LSOCF,F,F,RT) -> Result
++ integrate(exp, [a..b,c..d,...], epsabs, epsrel, routines) is a top
++ level ANNA function to integrate a multivariate expression, {\tt exp},
++ over a given set of ranges to the required absolute and relative
++ accuracy, using the routines available in the RoutinesTable provided.
++
++ It iterates over the \axiom{domains} of
++ \axiomType{NumericalIntegrationCategory} to get the name and other
++ relevant information of the the (domain of the) numerical
++ routine likely to be the most appropriate,
++ have the best \axiom{measure}.
++
++ It then performs the integration of the given expression
++ on that \axiom{domain}.

measure : NumericalIntegrationProblem -> Measure
++ measure(prob) is a top level ANNA function for identifying the most
++ appropriate numerical routine for solving the numerical integration
++ problem defined by \axiom{prob}.

```

```

++
++ It calls each \axiom{domain} of \axiom{category}
++ \axiomType{NumericalIntegrationCategory} in turn to calculate all measures
++ and returns the best
++ the name of the most appropriate domain and any other relevant
++ information.

measure : (NumericalIntegrationProblem,RT) -> Measure
++ measure(prob,R) is a top level ANNA function for identifying the most
++ appropriate numerical routine from those in the routines table
++ provided for solving the numerical integration
++ problem defined by \axiom{prob}.
++
++ It calls each \axiom{domain} listed in \axiom{R} of \axiom{category}
++ \axiomType{NumericalIntegrationCategory} in turn to calculate all measures
++ and returns the best
++ the name of the most appropriate domain and any other relevant
++ information.

integrate : (EF,SBOCF,ST) -> Union(Result,"failed")
++ integrate(exp, x = a..b, "numerical") is a top level ANNA function to
++ integrate an expression, {\tt exp}, over a given range, {\tt a}
++ to {\tt b}.
++
++ It iterates over the \axiom{domains} of
++ \axiomType{NumericalIntegrationCategory} to get the name and other
++ relevant information of the the (domain of the) numerical
++ routine likely to be the most appropriate,
++ have the best \axiom{measure}.
++
++ It then performs the integration of the given expression
++ on that \axiom{domain}.
++
++ Default values for the absolute and relative error are used.
++
++ It is an error of the last argument is not {\tt "numerical"}.

integrate : (EF,SBOCF,S) -> Union(Result,"failed")
++ integrate(exp, x = a..b, numerical) is a top level ANNA function to
++ integrate an expression, {\tt exp}, over a given range, {\tt a}
++ to {\tt b}.
++
++ It iterates over the \axiom{domains} of
++ \axiomType{NumericalIntegrationCategory} to get the name and other
++ relevant information of the the (domain of the) numerical
++ routine likely to be the most appropriate,
++ have the best \axiom{measure}.
++
++ It then performs the integration of the given expression
++ on that \axiom{domain}.

```

```

++
++ Default values for the absolute and relative error are used.
++
++ It is an error if the last argument is not {\tt numerical}.

measure : NumericalOptimizationProblem -> Measure
++ measure(prob) is a top level ANNA function for identifying the most
++ appropriate numerical routine from those in the routines table
++ provided for solving the numerical optimization problem defined by
++ \axiom{prob} by checking various attributes of the functions and
++ calculating a measure of compatibility of each routine to these
++ attributes.
++
++ It calls each \axiom{domain} of \axiom{category}
++ \axiomType{NumericalOptimizationCategory} in turn to calculate all
++ measures and returns the best the name of the most
++ appropriate domain and any other relevant information.

measure : (NumericalOptimizationProblem,RT) -> Measure
++ measure(prob,R) is a top level ANNA function for identifying the most
++ appropriate numerical routine from those in the routines table
++ provided for solving the numerical optimization problem defined by
++ \axiom{prob} by checking various attributes of the functions and
++ calculating a measure of compatibility of each routine to these
++ attributes.
++
++ It calls each \axiom{domain} listed in \axiom{R} of \axiom{category}
++ \axiomType{NumericalOptimizationCategory} in turn to calculate all
++ measures and returns the best the name of the most
++ appropriate domain and any other relevant information.

optimize : (NumericalOptimizationProblem,RT) -> Result
++ optimize(prob,routines) is a top level ANNA function to
++ minimize a function or a set of functions with any constraints
++ as defined within \axiom{prob}.
++
++ It iterates over the \axiom{domains} listed in \axiom{routines} of
++ \axiomType{NumericalOptimizationCategory}
++ to get the name and other relevant information of the best
++ \axiom{measure} and then optimize the function on that \axiom{domain}.

optimize : NumericalOptimizationProblem -> Result
++ optimize(prob) is a top level ANNA function to
++ minimize a function or a set of functions with any constraints
++ as defined within \axiom{prob}.
++

```

```

++ It iterates over the \axiom{domains} of
++ \axiomType{NumericalOptimizationCategory}
++ to get the name and other relevant information of the best
++ \axiom{measure} and then optimize the function on that \axiom{domain}.

goodnessOfFit : NumericalOptimizationProblem -> Result
++ goodnessOfFit(prob) is a top level ANNA function to
++ check to goodness of fit of a least squares model
++ as defined within \axiom{prob}.
++
++ It iterates over the \axiom{domains} of
++ \axiomType{NumericalOptimizationCategory}
++ to get the name and other relevant information of the best
++ \axiom{measure} and then optimize the function on that \axiom{domain}.
++ It then calls the numerical routine \axiomType{E04YCF} to get estimates
++ of the variance-covariance matrix of the regression coefficients of
++ the least-squares problem.
++
++ It thus returns both the results of the optimization and the
++ variance-covariance calculation.

optimize : (EF,LF,LOCF,LEF,LOCF) -> Result
++ optimize(f,start,lower,cons,upper) is a top level ANNA function to
++ minimize a function, \axiom{f}, of one or more variables with the
++ given constraints.
++
++ These constraints may be simple constraints on the variables
++ in which case \axiom{cons} would be an empty list and the bounds on
++ those variables defined in \axiom{lower} and \axiom{upper}, or a
++ mixture of simple, linear and non-linear constraints, where
++ \axiom{cons} contains the linear and non-linear constraints and
++ the bounds on these are added to \axiom{upper} and \axiom{lower}.
++
++ The parameter \axiom{start} is a list of the initial guesses of the
++ values of the variables.
++
++ It iterates over the \axiom{domains} of
++ \axiomType{NumericalOptimizationCategory}
++ to get the name and other relevant information of the best
++ \axiom{measure} and then optimize the function on that \axiom{domain}.

optimize : (EF,LF,LOCF,LOCF) -> Result
++ optimize(f,start,lower,upper) is a top level ANNA function to
++ minimize a function, \axiom{f}, of one or more variables with
++ simple constraints. The bounds on
++ the variables are defined in \axiom{lower} and \axiom{upper}.
++
++ The parameter \axiom{start} is a list of the initial guesses of the
++ values of the variables.
++

```

```

++ It iterates over the \axiom{domains} of
++ \axiomType{NumericalOptimizationCategory}
++ to get the name and other relevant information of the best
++ \axiom{measure} and then optimize the function on that \axiom{domain}.

optimize : (EF,LF) -> Result
++ optimize(f,start) is a top level ANNA function to
++ minimize a function, \axiom{f}, of one or more variables without
++ constraints.
++
++ The parameter \axiom{start} is a list of the initial guesses of the
++ values of the variables.
++
++ It iterates over the \axiom{domains} of
++ \axiomType{NumericalOptimizationCategory}
++ to get the name and other relevant information of the best
++ \axiom{measure} and then optimize the function on that \axiom{domain}.

optimize : (LEF,LF) -> Result
++ optimize(lf,start) is a top level ANNA function to
++ minimize a set of functions, \axiom{lf}, of one or more variables
++ without constraints a least-squares problem.
++
++ The parameter \axiom{start} is a list of the initial guesses of the
++ values of the variables.
++
++ It iterates over the \axiom{domains} of
++ \axiomType{NumericalOptimizationCategory}
++ to get the name and other relevant information of the best
++ \axiom{measure} and then optimize the function on that \axiom{domain}.

goodnessOfFit : (LEF,LF) -> Result
++ goodnessOfFit(lf,start) is a top level ANNA function to
++ check to goodness of fit of a least squares model the minimization
++ of a set of functions, \axiom{lf}, of one or more variables without
++ constraints.
++
++ The parameter \axiom{start} is a list of the initial guesses of the
++ values of the variables.
++
++ It iterates over the \axiom{domains} of
++ \axiomType{NumericalOptimizationCategory}
++ to get the name and other relevant information of the best
++ \axiom{measure} and then optimize the function on that \axiom{domain}.
++ It then calls the numerical routine \axiomType{E04YCF} to get estimates
++ of the variance-covariance matrix of the regression coefficients of
++ the least-squares problem.
++
++ It thus returns both the results of the optimization and the
++ variance-covariance calculation.

```

```

++
++ goodnessOfFit(lf,start) is a top level function to iterate over
++ the \axiom{domains} of \axiomType{NumericalOptimizationCategory}
++ to get the name and other relevant information of the best
++ \axiom{measure} and then optimize the function on that \axiom{domain}.
++ It then checks the goodness of fit of the least squares model.

SIG ==> with

solve : (NumericalODEProblem) -> Result
++ solve(odeProblem) is a top level ANNA function to solve numerically a
++ system of ordinary differential equations equations for the
++ derivatives y[1]'.y[n]' defined in terms of x,y[1]..y[n], together
++ with starting values for x and y[1]..y[n] (called the initial
++ conditions), a final value of x, an accuracy requirement and any
++ intermediate points at which the result is required.
++
++ It iterates over the \axiom{domains} of
++ \axiomType{OrdinaryDifferentialEquationsSolverCategory}
++ to get the name and other
++ relevant information of the the (domain of the) numerical
++ routine likely to be the most appropriate,

```

```

++ have the best \axiom{measure}.
++
++ The method used to perform the numerical
++ process will be one of the routines contained in the NAG numerical
++ Library. The function predicts the likely most effective routine
++ by checking various attributes of the system of ODE's and calculating
++ a measure of compatibility of each routine to these attributes.
++
++ It then calls the resulting 'best' routine.

solve : (NumericalODEProblem,RT) -> Result
++ solve(odeProblem,R) is a top level ANNA function to solve numerically a
++ system of ordinary differential equations equations for the
++ derivatives y[1]'.y[n]' defined in terms of x,y[1]..y[n], together
++ with starting values for x and y[1]..y[n] (called the initial
++ conditions), a final value of x, an accuracy requirement and any
++ intermediate points at which the result is required.
++
++ It iterates over the \axiom{domains} of
++ \axiomType{OrdinaryDifferentialEquationsSolverCategory} contained in
++ the table of routines \axiom{R} to get the name and other
++ relevant information of the the (domain of the) numerical
++ routine likely to be the most appropriate,
++ have the best \axiom{measure}.
++
++ The method used to perform the numerical
++ process will be one of the routines contained in the NAG numerical
++ Library. The function predicts the likely most effective routine
++ by checking various attributes of the system of ODE's and calculating
++ a measure of compatibility of each routine to these attributes.
++
++ It then calls the resulting 'best' routine.

solve : (VEF,F,F,LF) -> Result
++ solve(f,xStart,xEnd,yInitial) is a top level ANNA function to solve
++ numerically a system of ordinary differential equations equations
++ for the derivatives y[1]'.y[n]' defined in terms of x,y[1]..y[n],
++ together with a starting value for x and y[1]..y[n] (called the initial
++ conditions) and a final value of x. A default value
++ is used for the accuracy requirement.
++
++ It iterates over the \axiom{domains} of
++ \axiomType{OrdinaryDifferentialEquationsSolverCategory} contained in
++ the table of routines \axiom{R} to get the name and other
++ relevant information of the the (domain of the) numerical
++ routine likely to be the most appropriate,
++ have the best \axiom{measure}.
++
++ The method used to perform the numerical
++ process will be one of the routines contained in the NAG numerical

```

```

++ Library. The function predicts the likely most effective routine
++ by checking various attributes of the system of ODE's and calculating
++ a measure of compatibility of each routine to these attributes.
++
++ It then calls the resulting 'best' routine.

solve : (VEF,F,F,LF,F) -> Result
++ solve(f,xStart,xEnd,yInitial,tol) is a top level ANNA function to solve
++ numerically a system of ordinary differential equations, \axiom{f},
++ equations for the derivatives y[1]'.y[n]' defined in terms
++ of x,y[1]..y[n] from \axiom{xStart} to \axiom{xEnd} with the initial
++ values for y[1]..y[n] (\axiom{yInitial}) to a tolerance \axiom{tol}.
++
++ It iterates over the \axiom{domains} of
++ \axiomType{OrdinaryDifferentialEquationsSolverCategory} contained in
++ the table of routines \axiom{R} to get the name and other
++ relevant information of the the (domain of the) numerical
++ routine likely to be the most appropriate,
++ have the best \axiom{measure}.
++
++ The method used to perform the numerical
++ process will be one of the routines contained in the NAG numerical
++ Library. The function predicts the likely most effective routine
++ by checking various attributes of the system of ODE's and calculating
++ a measure of compatibility of each routine to these attributes.
++
++ It then calls the resulting 'best' routine.

solve : (VEF,F,F,LF,EF,F) -> Result
++ solve(f,xStart,xEnd,yInitial,G,tol) is a top level ANNA function to
++ solve numerically a system of ordinary differential equations,
++ \axiom{f}, equations for the derivatives y[1]'.y[n]' defined in
++ terms of x,y[1]..y[n] from \axiom{xStart} to \axiom{xEnd} with the
++ initial values for y[1]..y[n] (\axiom{yInitial}) to a tolerance
++ \axiom{tol}. The calculation will stop if the function
++ G(x,y[1],..,y[n]) evaluates to zero before x = xEnd.
++
++ It iterates over the \axiom{domains} of
++ \axiomType{OrdinaryDifferentialEquationsSolverCategory} contained in
++ the table of routines \axiom{R} to get the name and other
++ relevant information of the the (domain of the) numerical
++ routine likely to be the most appropriate,
++ have the best \axiom{measure}.
++
++ The method used to perform the numerical process will be one of the
++ routines contained in the NAG numerical Library. The function
++ predicts the likely most effective routine by checking various
++ attributes of the system of ODE's and calculating a measure of
++ compatibility of each routine to these attributes.
++

```

```

++ It then calls the resulting 'best' routine.

solve : (VEF,F,F,LF,LF,F) -> Result
++ solve(f,xStart,xEnd,yInitial,intVals,tol) is a top level ANNA function
++ to solve numerically a system of ordinary differential equations,
++ \axiom{f}, equations for the derivatives y[1]'.y[n]' defined in
++ terms of x,y[1]..y[n] from \axiom{xStart} to \axiom{xEnd} with the
++ initial values for y[1]..y[n] (\axiom{yInitial}) to a tolerance
++ \axiom{tol}. The values of y[1]..y[n] will be output for the values
++ of x in \axiom{intVals}.
++
++ It iterates over the \axiom{domains} of
++ \axiomType{OrdinaryDifferentialEquationsSolverCategory} contained in
++ the table of routines \axiom{R} to get the name and other
++ relevant information of the the (domain of the) numerical
++ routine likely to be the most appropriate,
++ have the best \axiom{measure}.
++
++ The method used to perform the numerical
++ process will be one of the routines contained in the NAG numerical
++ Library. The function predicts the likely most effective routine
++ by checking various attributes of the system of ODE's and calculating
++ a measure of compatibility of each routine to these attributes.
++
++ It then calls the resulting 'best' routine.

solve : (VEF,F,F,LF,EF,LF,F) -> Result
++ solve(f,xStart,xEnd,yInitial,G,intVals,tol) is a top level ANNA
++ function to solve numerically a system of ordinary differential
++ equations, \axiom{f}, equations for the derivatives y[1]'.y[n]'
++ defined in terms of x,y[1]..y[n] from \axiom{xStart} to \axiom{xEnd}
++ with the initial values for y[1]..y[n] (\axiom{yInitial}) to a

++
++ The method used to perform the numerical
++ process will be one of the routines contained in the NAG numerical
++ Library. The function predicts the likely most effective routine
++ by checking various attributes of the system of ODE's and calculating
++ a measure of compatibility of each routine to these attributes.
++
++ It then calls the resulting 'best' routine.

```

```

solve : (VEF,F,F,LF,EF,LF,F,F) -> Result
++ solve(f,xStart,xEnd,yInitial,G,intVals,epsabs,epsrel) is a top level
++ ANNA function to solve numerically a system of ordinary differential
++ equations, \axiom{f},
++ equations for the derivatives y[1]'.y[n]' defined in terms
++ of x,y[1]..y[n] from \axiom{xStart} to \axiom{xEnd} with the initial
++ values for y[1]..y[n] (\axiom{yInitial}) to an absolute error
++ requirement \axiom{epsabs} and relative error \axiom{epsrel}.
++ The values of y[1]..y[n] will be output for the values of x in
++ \axiom{intVals}. The calculation will stop if the function
++ G(x,y[1],..,y[n]) evaluates to zero before x = xEnd.
++
++ It iterates over the \axiom{domains} of
++ \axiomType{OrdinaryDifferentialEquationsSolverCategory} contained in
++ the table of routines \axiom{R} to get the name and other
++ relevant information of the the (domain of the) numerical
++ routine likely to be the most appropriate,
++ have the best \axiom{measure}.
++
++ The method used to perform the numerical
++ process will be one of the routines contained in the NAG numerical
++ Library. The function predicts the likely most effective routine
++ by checking various attributes of the system of ODE's and calculating
++ a measure of compatibility of each routine to these attributes.
++
++ It then calls the resulting 'best' routine.

measure : (NumericalODEProblem) -> Measure
++ measure(prob) is a top level ANNA function for identifying the most
++ appropriate numerical routine from those in the routines table
++ provided for solving the numerical ODE
++ problem defined by \axiom{prob}.
++
++ It calls each \axiom{domain} of \axiom{category}
++ \axiomType{OrdinaryDifferentialEquationsSolverCategory} in turn to
++ calculate all measures and returns the best the name of
++ the most appropriate domain and any other relevant information.
++ It predicts the likely most effective NAG numerical
++ Library routine to solve the input set of ODEs
++ by checking various attributes of the system of ODEs and calculating
++ a measure of compatibility of each routine to these attributes.

measure : (NumericalODEProblem,RT) -> Measure
++ measure(prob,R) is a top level ANNA function for identifying the most
++ appropriate numerical routine from those in the routines table
++ provided for solving the numerical ODE
++ problem defined by \axiom{prob}.
++
++ It calls each \axiom{domain} listed in \axiom{R} of \axiom{category}

```

```

++ \axiomType{OrdinaryDifferentialEquationsSolverCategory} in turn to
++ calculate all measures and returns the best the name of
++ the most appropriate domain and any other relevant information.
++ It predicts the likely most effective NAG numerical
++ Library routine to solve the input set of ODEs
++ by checking various attributes of the system of ODEs and calculating
++ a measure of compatibility of each routine to these attributes.

solve : (NumericalPDEProblem) -> Result
++ solve(PDEProblem) is a top level ANNA function to solve numerically
++ a system of partial differential equations.
++
++ The method used to perform the numerical
++ process will be one of the routines contained in the NAG numerical
++ Library. The function predicts the likely most effective routine
++ by checking various attributes of the system of PDE's and calculating
++ a measure of compatibility of each routine to these attributes.
++
++ It then calls the resulting 'best' routine.
++
++ ** At the moment, only Second Order Elliptic Partial Differential
++ Equations are solved **

solve : (NumericalPDEProblem,RT) -> Result
++ solve(PDEProblem,routines) is a top level ANNA function to solve numerically a system
++ of partial differential equations.
++
++ The method used to perform the numerical
++ process will be one of the routines contained in the NAG numerical
++ Library. The function predicts the likely most effective routine
++ by checking various attributes of the system of PDE's and calculating
++ a measure of compatibility of each routine to these attributes.
++
++ It then calls the resulting 'best' routine.
++
++ ** At the moment, only Second Order Elliptic Partial Differential
++ Equations are solved **

solve : (F,F,F,F,NNI,NNI,LEF,List LEF,ST,DF) -> Result
++ solve(xmin,ymin,xmax,ymax,ngx,ngy,pde,bounds,st,tol) is a top level

```

```

++ ANNA function to solve numerically a system of partial differential
++ equations. This is defined as a list of coefficients (\axiom{pde}),
++ a grid (\axiom{xmin}, \axiom{ymin}, \axiom{xmax}, \axiom{ymax},
++ \axiom{ngx}, \axiom{ngy}), the boundary values (\axiom{bounds}) and a
++ tolerance requirement (\axiom{tol}). There is also a parameter
++ (\axiom{st}) which should contain the value "elliptic" if the PDE is
++ known to be elliptic, or "unknown" if it is uncertain. This causes the
++ routine to check whether the PDE is elliptic.
++
++ The method used to perform the numerical
++ process will be one of the routines contained in the NAG numerical
++ Library. The function predicts the likely most effective routine
++ by checking various attributes of the system of PDE's and calculating
++ a measure of compatibility of each routine to these attributes.
++
++ It then calls the resulting 'best' routine.
++
++ ** At the moment, only Second Order Elliptic Partial Differential
++ Equations are solved **

solve : (F,F,F,F,NNI,NNI,LEF,List LEF,ST) -> Result
++ solve(xmin,ymin,xmax,ymax,ngx,ngy,pde,bounds,st) is a top level
++ ANNA function to solve numerically a system of partial differential
++ equations. This is defined as a list of coefficients (\axiom{pde}),
++ a grid (\axiom{xmin}, \axiom{ymin}, \axiom{xmax}, \axiom{ymax},
++ \axiom{ngx}, \axiom{ngy}) and the boundary values (\axiom{bounds}).
++ A default value for tolerance is used. There is also a parameter
++ (\axiom{st}) which should contain the value "elliptic" if the PDE is
++ known to be elliptic, or "unknown" if it is uncertain. This causes the
++ routine to check whether the PDE is elliptic.
++
++ The method used to perform the numerical
++ process will be one of the routines contained in the NAG numerical
++ Library. The function predicts the likely most effective routine
++ by checking various attributes of the system of PDE's and calculating
++ a measure of compatibility of each routine to these attributes.
++
++ It then calls the resulting 'best' routine.
++
++ ** At the moment, only Second Order Elliptic Partial Differential
++ Equations are solved **

measure : (NumericalPDEProblem) -> Measure
++ measure(prob) is a top level ANNA function for identifying the most
++ appropriate numerical routine from those in the routines table
++ provided for solving the numerical PDE
++ problem defined by \axiom{prob}.
++
++ It calls each \axiom{domain} of \axiom{category}
++ \axiomType{PartialDifferentialEquationsSolverCategory} in turn to

```

```

++ calculate all measures and returns the best the name of
++ the most appropriate domain and any other relevant information.
++ It predicts the likely most effective NAG numerical
++ Library routine to solve the input set of PDEs
++ by checking various attributes of the system of PDEs and calculating
++ a measure of compatibility of each routine to these attributes.

measure : (NumericalPDEProblem,RT) -> Measure
++ measure(prob,R) is a top level ANNA function for identifying the most
++ appropriate numerical routine from those in the routines table
++ provided for solving the numerical PDE
++ problem defined by \axiom{prob}.
++
++ It calls each \axiom{domain} listed in \axiom{R} of \axiom{category}
++ \axiomType{PartialDifferentialEquationsSolverCategory} in turn to
++ calculate all measures and returns the best the name of
++ the most appropriate domain and any other relevant information.
++ It predicts the likely most effective NAG numerical
++ Library routine to solve the input set of PDEs
++ by checking various attributes of the system of PDEs and calculating
++ a measure of compatibility of each routine to these attributes.

AnyFunctions1 (ANY1)**Exports:**

coerce retract retractable? retractIfCan

— package ANY1 AnyFunctions1 —

```

)abbrev package ANY1 AnyFunctions1
++ Description:
++ \spadtype{AnyFunctions1} implements several utility functions for
++ working with \spadtype{Any}. These functions are used to go back
++ and forth between objects of \spadtype{Any} and objects of other
++ types.

AnyFunctions1(S) : SIG == CODE where
  S:Type

  SIG ==> with

    coerce : S -> Any
      ++ coerce(s) creates an object of \spadtype{Any} from the
      ++ object \spad{s} of type \spad{S}.

    retractIfCan : Any -> Union(S, "failed")
      ++ retractIfCan(a) tries change \spad{a} into an object
      ++ of type \spad{S}. If it can, then such an object is
      ++ returned. Otherwise, "failed" is returned.

    retractable? : Any -> Boolean
      ++ retractable?(a) tests if \spad{a} can be converted
      ++ into an object of type \spad{S}.

    retract : Any -> S
      ++ retract(a) tries to convert \spad{a} into an object of
      ++ type \spad{S}. If possible, it returns the object.
      ++ Error: if no such retraction is possible.
  
```

```

CODE ==> add

=====
ApplicationProgramInterface examples
=====

```

This package contains useful functions that expose Axiom system internals

The ApplicationProgramInterface exposes Axiom internal functions

which might be useful for understanding, debugging, or creating tools.

The `getDomains` function takes the name of a category and returns a set of domains which inherit from that category:

```
getDomains 'Collection

{AssociationList, Bits, CharacterClass, ComplexDoubleFloatVector, DataList,
 DoubleFloatVector, EqTable, FlexibleArray, GeneralPolynomialSet,
 GeneralSparseTable, GeneralTriangularSet, HashTable, IndexedBits,
 IndexedFlexibleArray, IndexedList, IndexedOneDimensionalArray,
 IndexedString, IndexedVector, InnerTable, KeyedAccessFile, Library, List,
 ListMultiDictionary, Multiset, NeitherSparseOrDensePowerSeries,
 OneDimensionalArray, Point, PrimitiveArray, RegularChain,
 RegularTriangularSet, Result, RoutinesTable, Set, SparseTable,
 SquareFreeRegularTriangularSet, Stream, String, StringTable, Table,
 U32Vector, Vector, WuWenTsunTriangularSet}
```

Type: Set Symbol

This can be used to form the set-difference of two categories:

```
difference(getDomains 'IndexedAggregate, getDomains 'Collection)

{DirectProduct, DirectProductMatrixModule, DirectProductModule,
 HomogeneousDirectProduct, OrderedDirectProduct,
 SplitHomogeneousDirectProduct}
```

Type: Set Symbol

The `credits` function prints a list of the people who have contributed to the development of Axiom. This is equivalent to the `)credits` command.

The `summary` function prints a short list of useful console commands.

The `getAncestors` function takes the name of a domain or category and returns a list of categories from which it inherits.

```
getAncestors 'IndexedAggregate

{Aggregate, BasicType, CoercibleTo, Eltable, EltableAggregate, Evaluable,
 HomogeneousAggregate, InnerEvaluable, SetCategory, Type}
```

Type: Set(Symbol)

The `reportInstantiations` function information about what domains are instantiated by an expression. In a clean Axiom you'll see

```
(1) -> reportInstantiations(true)

# instantiated/# dropped/domain name
-----
```

Type: Void

```

1 0 Void
1 0 String
1 0 SingleInteger
1 0 PrimitiveArray(OutputForm)
1 0 OutputForm
1 0 List(OutputForm)
1 0 Integer
1 0 Character
Totals: 8 instantiated
      0 inside coerceInteractive
      0 inside canCoerceFrom
      0 inside evalMmCond
      0 reinstatiated
      0 dropped
      8 distinct domains instantiated/dropped

```

Which shows that 8 domains were instantiated.
 If a new domain is requested, more will be instantiated.

(2) -> 1

(2) 1

Type: PositiveInteger

```

# instantiated/# dropped/domain name
-----
1 0 PositiveInteger
1 0 NonNegativeInteger
Totals: 2 instantiated
      0 inside coerceInteractive
      0 inside canCoerceFrom
      0 inside evalMmCond
      0 reinstatiated
      0 dropped
      2 distinct domains instantiated/dropped

```

However, this happens only once. Invoking already instantiated domains does nothing since they already exist.

(3) -> 1

(3) 1

Type: PositiveInteger

```

# instantiated/# dropped/domain name
-----
Totals: 0 instantiated
      0 inside coerceInteractive
      0 inside canCoerceFrom
      0 inside evalMmCond
      0 reinstatiated
      0 dropped

```

0 distinct domains instantiated/dropped

We call the function with false to turn off this information.

(4) -> reportInstantiations(false)

Type: Void

  getDatabase(constructor:String, key:String):String ==
    answer:=string GETDATABASE(INTERN$Lisp constructor,INTERN$Lisp key)$Lisp
    -- WriteLine$Lisp concat ["getDatabase: ",constructor," ",key," ",answer]
    answer

```

The axServer function handles the socket connection on the given port. When it gets a input on the socket it calls the server function on the socket input.

— package AXSERV AxiomServer —

```

axServer(port:Integer,serverfunc:SExpression->Void):Void ==
  WriteLine$Lisp "listening on port 8085"
  s := SiSock(port,serverfunc)$Lisp
  -- To listen for just one connection and then close the socket
  -- uncomment i := 0.
  i:Integer := 1
  while (i > 0) repeat
    if not null?(SiListen(s)$Lisp)$SExpression then
      w := SiAccept(s)$Lisp
      serverfunc(w)

```

The multiServ function parses the socket input. It expects either a GET or POST request. A GET request fetches a new page, calling “getFile”. A POST request starts with

- “command=” which expects axiom interpreter commands. When this is recognized we call the “getCommand” function.
- “lispcall=” which expects lisp interpreter input. When this is recognized we call the “getLisp” function.

— package AXSERV AxiomServer —

```
multiServ(s:SExpression):Void ==
-- WriteLine("multiServ begin")$Lisp
headers:String := ""
char:String
-- read in the http headers
while (char := _
  STRING(READ_-CHAR_-NO_-HANG(s,NIL$Lisp,'EOF)$Lisp)$Lisp) ^= "EOF"_
  repeat
    headers := concat [headers,char]

  getInterp(s,headers.u)
if reqtype = "POST" and StringMatch("lispcall=(.*)$",headers)$Lisp > 0
then
```

```

    u:UniversalSegment(Integer)
    u := segment(MatchBeginning(1)$Lisp+1,_
                 MatchEnd(1)$Lisp)$UniversalSegment(Integer)
    getLisp(s,headers.u)
if rectype = "POST" and StringMatch("showcall=(.*)$",headers)$Lisp > 0
then
    u:UniversalSegment(Integer)
    u := segment(MatchBeginning(1)$Lisp+1,_
                 MatchEnd(1)$Lisp)$UniversalSegment(Integer)
    getShow(s,headers.u)
-- WriteLine("multiServ end")$Lisp
-- WriteLine("")$Lisp

```

getFile

Given a socket and the URL of the file we create an input stream that contains the file. If the filename contains a question mark then we need to parse the parameters and dynamically construct the file contents.

— package AXSERV AxiomServer —

```

getFile(s:SExpression,pathvar:String):Void ==
-- WriteLine("")$Lisp
WriteLine$Lisp concat ["getFile: ",pathvar]
params:=split(pathvar,char "?")
if #params = 1
then if not null? PATHNAME_-NAME(PATHNAME(pathvar)$Lisp)$Lisp
then
    contentType:String := getContentType(pathvar)
    q:=Open(pathvar)$Lisp
    if null? q
    then
        q := MAKE_-STRING_-INPUT_-STREAM(_
            makeErrorPage("File doesn't exist"))$Lisp
    else
        q:=MAKE_-STRING_-INPUT_-STREAM(_
            makeErrorPage("Problem with file path"))$Lisp
    else
        q:=MAKE_-STRING_-INPUT_-STREAM(makeDBPage(pathvar))$Lisp
outputToSocket(s,readTheFile(q),contentType)

```

makeErrorPage

— package AXSERV AxiomServer —

```
makeErrorPage(msg:String):String ==
  page:String="<!DOCTYPE html PUBLIC "
  page:=page "_-//W3C//DTD XHTML 1.0 Strict//EN_ "
  page:=page "_http://www.w3.org/TR/xhtml1/DTD/xhtml1-strict.dtd_">"
  page:=page "<html xmlns=_http://www.w3.org/1999/xhtml_">"
  page:=page "<head><title>Error</title></head><body>" msg "</body></html>"
  -- WriteLine(page)$Lisp
  page
```

getDescription

We need to fish around in the data structure to return the piece of documentation for the domain. We have to call the lisp version of GETDATABASE because the version above returns a string object. The string object is missing quotes and cannot be properly read. So we need to get the lisp object and work with it in native form first.

The doc string also contains spad markup which we need to replace with html.

— package AXSERV AxiomServer —

```
getDescription(dom:String):String ==
  d:=CADR(CADR(GETDATABASE(INTERN(dom)$Lisp,'DOCUMENTATION)$Lisp)$Lisp)$Lisp
  string d
```

getSourceFile

During build we construct a hash table that takes the chunk name as the key and returns the filename. We reconstruct the chunk name here and do a lookup for the source file.

— package AXSERV AxiomServer —

```
getSourceFile(constructorkind:String,_
  abbreviation:String,_
  dom:String):String ==
  sourcekey:="@<<" constructorkind " " abbreviation " " dom ">>"
  -- WriteLine(sourcekey)$Lisp
  sourcefile:=lowerCase last split(getDatabase(dom,"SOURCEFILE"),char "/")
  sourcefile:=sourcefile ".pamphlet"
```

makeDBPage

— package AXSERV AxiomServer —

```

makeDBPage(pathvar:String):String ==

page

```

readTheFile

We have `q` which is a stream which contains the file. We read the file into a string-stream to get it all into one string. We return the string.

— package AXSERV AxiomServer —

```
readTheFile(q:SEExpression):String ==
  -- WriteLine("begin reading file")$Lisp
  r := MAKE_-STRING_-OUTPUT_-STREAM()$Lisp
  SiCopyStream(q,r)$Lisp
  filestream:String := GET_-OUTPUT_-STREAM_-STRING(r)$Lisp
  CLOSE(r)$Lisp
  CLOSE(q)$Lisp
  -- WriteLine("end reading file")$Lisp
  filestream
```

outputToSocket

We have “s” which is the socket, “filestream” which is the text of the file to output, and “contentType” which is the HTML Content-Type. We construct the HTML header information according to the standard and prepend it to the file. The resulting string is output to the socket.

— package AXSERV AxiomServer —

```
outputToSocket(s:SEExpression,filestream:String,contentType:String):Void ==
  filelength:String := string(#filestream)
  file:String := ""
  nl:String:=STRING(NewLine$Lisp)$Lisp
  file := concat ["Content-Length: ",filelength,nl,nl,file]
  file := concat ["Connection: close",nl,file]
  file := concat ["Content-Type: ",contentType,nl,file]
  file := concat ["HTTP/1.1 200 OK",nl,file]
  file := concat [file,filestream]
  -- WriteLine(file)$Lisp
  f:=MAKE_-STRING_-INPUT_-STREAM(file)$Lisp
  SiCopyStream(f,s)$Lisp
  CLOSE(f)$Lisp
  CLOSE(s)$Lisp
```

getCommand

The getCommand function is invoked when the HTTP request is a POST and contains the string “command”. Essentially the game here is to rebind the various output streams used by Axiom so we can capture the normal output. This function returns a set of HTML 5 div blocks:

1. stepnum, the value of lastStep()
2. command, the value of the command variable
3. algebra, the value of the algebra variable
4. mathml, the value of the mathml variable
5. type, the value of lastType()

The HTML functions in the hyperdoc browser depend on the order of these variables so do not change this without changing the corresponding functions in the browser HTML.

— package AXSERV AxiomServer —

```

getCommand(s:SExpression,command:String):Void ==
  WriteLine$Lisp concat ["getCommand: ",command]
  SETQ(tmpmathml$Lisp, MAKE_-STRING_-OUTPUT_-STREAM()$Lisp)$Lisp

CLOSE(s)$Lisp

```

getShow

The `getShow` function is invoked when the HTTP request is a POST and contains the string "showcall". The `)show` command generates output to lisp's `*standard-output*` so we wrap that stream to capture it. The resulting string needs to be transformed into html-friendly form. This is done in the call to `replace-entitites` (see `http.lisp`)

— package **AXSERV** **AxiomServer** —

CLOSE(s)$Lisp

```

lastType

To examine the \$internalHistoryTable use the following line

```
)lisp |$internalHistoryTable|
```

We need to pick out first member of internalHistoryTable and then pick out the element with % as first element. Here is an example showing just the first element of the list, which corresponds to the last command.

Note that the last command does not necessarily correspond to the last element of the first element of \$internalHistoryTable as it is in this example.

```

(
(4 NIL
(x (value (BasicOperator) WRAPPED . #<vector 09a93bd0>))
(y (value (BasicOperator) WRAPPED . #<vector 09a93bb4>))
(% (value (Matrix (Polynomial (Integer))) WRAPPED . #<vector 0982e0e0>))

```

```
)
...
)
```

We also need to check for input error in which case the \$internalHistoryTable is not changed and the type retrieved would be that for the last correct input.

— package AXSERV AxiomServer —

```

o)show BasicOperatorFunctions1

BasicOperatorFunctions1 (BOP1)

Exports:

constantOpIfCan constantOperator derivative evaluate

— package BOP1 BasicOperatorFunctions1 —

```

)abbrev package BOP1 BasicOperatorFunctions1
++ Author: Manuel Bronstein
++ Date Created: 28 Mar 1988
++ Date Last Updated: 15 May 1990
++ Description:
++ This package exports functions to set some commonly used properties
++ of operators, including properties which contain functions.

BasicOperatorFunctions1(A) : SIG == CODE where
  A:SetCategory

  OP    ==> BasicOperator
  EVAL  ==> "%eval"
  CONST ==> "%constant"
  DIFF  ==> "%diff"
  OUT   ==> OutputForm
  IN    ==> InputForm

  SIG ==> with

    evaluate : (OP, List A) -> Union(A, "failed")
      ++ evaluate(op, [a1,...,an]) checks if op has an "%eval"
      ++ property f. If it has, then \spad{f(a1,...,an)} is returned, and
      ++ "failed" otherwise.

    evaluate : (OP, List A -> A) -> OP
      ++ evaluate(op, foo) attaches foo as the "%eval" property
      ++ of op. If op has an "%eval" property f, then applying op
      ++ to \spad{f(a1,...,an)} returns the result of \spad{f(a1,...,an)}.
  
```

```

evaluate : (OP, A -> A) -> OP
++ evaluate(op, foo) attaches foo as the "%eval" property
++ of op. If op has an "%eval" property f, then applying op
++ to a returns the result of \spad{f(a)}. Argument op must be unary.

evaluate : OP -> Union(List A -> A, "failed")
++ evaluate(op) returns the value of the "%eval" property of
++ op if it has one, and "failed" otherwise.

derivative : (OP, List (List A -> A)) -> OP
++ derivative(op, [foo1,...,foon]) attaches [foo1,...,foon] as
++ the "%diff" property of op. If op has an "%diff" property
++ \spad{[f1,...,fn]} then applying a derivation D
++ to \spad{op(a1,...,an)}
++ returns \spad{f1(a1,...,an) * D(a1) + ... + fn(a1,...,an) * D(an)}.

derivative : (OP, A -> A) -> OP
++ derivative(op, foo) attaches foo as the "%diff" property
++ of op. If op has an "%diff" property f, then applying a
++ derivation D to op(a) returns \spad{f(a) * D(a)}.
++ Argument op must be unary.

derivative : OP -> Union(List(List A -> A), "failed")
++ derivative(op) returns the value of the "%diff" property of
++ op if it has one, and "failed" otherwise.

if A has OrderedSet then

constantOperator : A -> OP
++ constantOperator(a) returns a nullary operator op
++ such that \spad{op()} always evaluate to \spad{a}.

constantOpIfCan : OP -> Union(A, "failed")
++ constantOpIfCan(op) returns \spad{a} if op is the constant
++ nullary operator always returning \spad{a}, "failed" otherwise.

CODE ==> add

Provide linear, quadratic, and cubic spline bezier curves

BezoutMatrix contains functions for computing resultants and discriminants using Bezout matrices.

A linear Bezier curve is a simple interpolation between the starting point and the ending point based on a parameter t .

Given a start point $a=[x_1,y_1]$ and an endpoint $b=[x_2,y_2]$

$f(t) == [(1-t)*x_1 + t*x_2, (1-t)*y_1 + t*y_2]$

$n := \text{linearBezier}([2.0, 2.0], [4.0, 4.0])$

$\text{theMap}(\text{BEZIER}; \text{linearBezier}; 2\text{LM}; 1!0, 707)$

$[n(t/10.0) \text{ for } t \text{ in } 0..10 \text{ by } 1]$

$[[2.0, 2.0], [2.2, 2.2], [2.4, 2.4], [2.6, 2.6], [2.8, 2.8], [3.0, 3.0],$
 $[3.2, 3.2], [3.4, 3.4], [3.6, 3.6], [3.8, 3.8], [4.0, 4.0]]$

A quadratic Bezier curve is a simple interpolation between the starting point, a middle point, and the ending point based on a parameter t .

Given a start point $a=[x_1,y_1]$, a middle point $b=[x_2,y_2]$,
 and an endpoint $c=[x_3,y_3]$

```

f(t) == [(1-t)^2 x1 + 2t(1-t) x2 + t^2 x3,
          (1-t)^2 y1 + 2t(1-t) y2 + t^2 y3]

n:=quadraticBezier([2.0,2.0],[4.0,4.0],[6.0,2.0])
  theMap(BEZIER;quadraticBezier;3LM;2!0,291)

[n(t/10.0) for t in 0..10 by 1]
  [[2.0,2.0], [2.4,2.36], [2.8,2.64], [3.2,2.84], [3.6,2.96], [4.0,3.0],
   [4.4,2.96], [4.8,2.84], [5.2,2.64], [5.6,2.36], [6.0,2.0]]

```

A cubic Bezier curve is a simple interpolation between the starting point, a left-middle point, a right-middle point, and the ending point based on a parameter t .

Given a start point $a=[x1,y1]$, the left-middle point $b=[x2,y2]$, the right-middle point $c=[x3,y3]$ and an endpoint $d=[x4,y4]$

```

f(t) == [(1-t)^3 x1 + 3t(1-t)^2 x2 + 3t^2 (1-t) x3 + t^3 x4,
          (1-t)^3 y1 + 3t(1-t)^2 y2 + 3t^2 (1-t) y3 + t^3 y4]

n:=cubicBezier([2.0,2.0],[2.0,4.0],[6.0,4.0],[6.0,2.0])
  theMap(BEZIER;cubicBezier;4LM;3!0,915)

[n(t/10.0) for t in 0..10 by 1]
  [[2.0,2.0], [2.112,2.54], [2.416,2.96], [2.864,3.26], [3.408,3.44],
   [4.0,3.5], [4.592,3.44], [5.136,3.26], [5.584,2.96], [5.888,2.54],
   [6.0,2.0]]

```

Bezier curves "move" based on moving their control points, which in the case of the three components of a quadratic Bezier curve are the three points given. To see this motion we can show what happens when you "drag" the middle control point along the line from $[-4,4]$ to $[4,4]$ by increments of 1.

First, we form the line as a list of Floats, 9 in all.

```
line:=[i::Float,4.0] for i in -4..4 by 1]
```

Next, we form a list of functions, each with a different center control point. Notice that the endpoints remain fixed so we expect that the curve will begin and end at the same point but that the midpoint is pulled around.

```
functions:=[quadraticBezier([2.0,2.0],m,[6.0,2.0]) for m in line]
```

Then we form a list of the graphs by calling each function in the above list. Each function call happens 101 times (to include both endpoints). Thus we get a List of Lists of Points of DoubleFloats

```
graphs=[ [ point( ( functions.i)(j/100.0) )::LIST(DFLOAT) ) _
          for j in 0..100] for i in 1..9]
```

We draw the first graph to see if it looks reasonable:

```
d1:=draw(graphs.1)
```

Since it does we add the other 8 graphs. The 2D graphs can hold up to 9 simultaneous graphs.

```
others:=[graphs.i for i in 2..9]
for i in 2..9 for graph in others repeat putGraph(d1,[graph],i)
```

and now we display them all on one graph.

```
vp:=makeViewport2D(d1)
```

CODE ==> add

```

The Sylvester matrix is used to compute the **resultant** of two polynomials. The Sylvester matrix is formed from the coefficients of the two polynomials. Given a polynomial with degree m and another of degree n form an $(m+n) \times (m+n)$ matrix by filling the matrix from the upper left corner with the coefficients of the first polynomial then shifting down one row and one column to the right and filling in the coefficients starting there until they hit the right column. Starting at the next row, do the same process for the second polynomial. The determinant of this matrix is the **resultant** of the two polynomials.

For example, given $a_3x^3 + a_2x^2 + a_1x + a_0$ and $b_2x^2 + b_1x + b_0$ the Sylvester matrix is a $(3+2) \times (3+2)$ matrix:

$$\begin{bmatrix} a_3 & a_2 & a_1 & a_0 & 0 \\ 0 & a_3 & a_2 & a_1 & a_0 \\ b_2 & b_1 & b_0 & 0 & 0 \\ 0 & b_2 & b_1 & b_0 & 0 \\ 0 & 0 & b_2 & b_1 & b_0 \end{bmatrix}$$

The resultant of these two polynomials (assuming a leading coefficient of 1), is the product of the differences $p_i - q_i$ between the roots of the polynomials. If there are roots in common then the product will contain a 0 and the whole equation reduces to 0. This can be used to determine if two polynomials have common roots.

In symbolic form the resultant can show the multiplicity of roots.

  SIG ==> with

  applyTransform : (PolyRing,BLMET) -> PolyRing
    ++ applyTransform(pol,chart) apply the quadratique transformation to
    ++ pol specified by chart which consist of 3 integers. The last one
    ++ indicates which variables is set to 1, the first one indicates
    ++ which variable remains unchange, and the second one indicates
    ++ which variable on which the transformation is applied.
    ++ For example, [2,3,1] correspond to the following:
    ++ x -> 1, y -> y, z -> yz (here the variable are [x,y,z] in BlUpRing).

  quadTransform : (BlUpRing,NNI,BLMET) -> BlUpRing -- CHH
    ++ quadTransform(pol,n,chart) apply the quadratique transformation
    ++ to pol specified by chart has in quadTransform(pol,chart) and
    ++ extract x**n to it, where x is the variable specified by the
    ++ first integer in chart (blow-up exceptional coordinate).
```

```

stepBlowUp : (BlUpRing,AFP,BLMET,K) -> blowUpReturn -- CHH
++ stepBlowUp(pol,pt,n) blow-up the point pt on the curve defined
++ by pol in the affine neighbourhood specified by n.

newtonPolySlope : BlUpRing -> List List(NNI)

++ Description:
++ This package has no description

BrillhartTests(UP) : SIG == CODE where
  Z ==> Integer
  UP: UnivariatePolynomialCategory Z

  N ==> NonNegativeInteger

  SIG ==> with

    brillhartIrreducible? : UP -> Boolean -- See [1]
      ++ brillhartIrreducible?(p) returns \spad{true} if p can be shown to be
      ++ irreducible by a remark of Brillhart, \spad{false} is inconclusive.

    brillhartIrreducible? : (UP,Boolean) -> Boolean -- See [1]
      ++ brillhartIrreducible?(p,noLinears) returns \spad{true} if p can be
      ++ shown to be irreducible by a remark of Brillhart, \spad{false} else.
      ++ If noLinears is \spad{true}, we are being told p has no linear factors
      ++ \spad{false} does not mean that p is reducible.

    brillhartTrials : () -> N
      ++ brillhartTrials() returns the number of tests in
      ++ \spadfun{brillhartIrreducible?}.

    brillhartTrials : N -> N
      ++ brillhartTrials(n) sets to n the number of tests in
      ++ \spadfun{brillhartIrreducible?} and returns the previous value.

    noLinearFactor? : UP -> Boolean -- See [3] p. 47
      ++ noLinearFactor?(p) returns \spad{true} if p can be shown to have no
      ++ linear factor by a theorem of Lehmer, \spad{false} else. I insist on
      ++ the fact that \spad{false} does not mean that p has a linear factor.

=====
CombinatorialFunction examples
=====
```

Provides combinatorial functions over an integral domain.

f := operator 'f

(1) f

Type: BasicOperator

D(product(f(i,x),i=1..m),x)

$$(2) \quad \begin{array}{c} \begin{array}{cc} m & m \\ ++-++ & --+ \\ | & | \\ | & | \\ i=1 & i=1 \end{array} f(i,x) > \frac{f(i,x)^m}{2} \end{array}$$

Type: Expression Integer

The binomial(n, r) returns the number of subsets of r objects taken among n objects, $n!/(r! * (n-r)!)$

The binomial coefficients are the coefficients of the series expansion of a power of a binomial, that is

$$\begin{array}{c} n \\ --+ \quad / \quad n \quad \backslash \quad k \\ > \quad | \quad \quad | \quad x \quad = \quad (1 + x)^n \\ --+ \quad \backslash \quad k \quad / \\ k=0 \end{array}$$

This leads to the famous pascal triangle. First we expose the OutputForm domain, which is normally hidden, so we can use it to format the lines.

```
)set expose add constructor OutputForm
```

Next we define a function that will output the list of binomial coefficients right justified with proper spacing:

```
pascalRow(n) == [right(binomial(n,i),4) for i in 0..n]
```

and now we format the whole line so that it looks centered:

```
displayRow(n)==output center blankSeparate pascalRow(n)
```

and we compute the triangle

```
for i in 0..7 repeat displayRow i
```

giving the pretty result:

```
Compiling function pascalRow with type NonNegativeInteger -> List
  OutputForm
Compiling function displayRow with type NonNegativeInteger -> Void
```

binomial

We currently simplify binomial coefficients only for non-negative integral second argument, using the formula

$$\binom{n}{k} = \frac{1}{k!} \prod_{i=0..k-1} (n-i),$$

except if the second argument is symbolic: in this case binomial(n,n) is simplified to one.

Note that there are at least two different ways to define binomial coefficients for negative integral second argument. One way, particular suitable for combinatorics, is to set the binomial coefficient equal to zero for negative second argument. This is, partially, also the approach taken in `combinat.spad`, where we find

```
binomial(n, m) ==
  n < 0 or m < 0 or m > n => 0
  m = 0 => 1
```

Of course, here n and m are integers. This definition agrees with the recurrence

$$\binom{n}{k} + \binom{n}{k+1} = \binom{n+1}{k+1}.$$

Alternatively, one can use the formula

$$\binom{n}{k} = \frac{\Gamma(n+1)}{\Gamma(k+1)\Gamma(n-k+1)},$$

and leave the case where $k \in \mathbf{Z}$, $n \in \mathbf{Z}$ and $k \leq n < 0$ undefined, since the limit does not exist in this case:

Since we then have that $n - k + 1 \geq 1$, $\Gamma(n - k + 1)$ is finite. So it is sufficient to consider $\frac{\Gamma(n+1)}{\Gamma(k+1)}$. On the one hand, we have

$$\lim_{n_0 \rightarrow n} \lim_{k_0 \rightarrow k} \frac{\Gamma(n_0 + 1)}{\Gamma(k_0 + 1)} = 0,$$

since for any non-integral n_0 , $\Gamma(n_0 + 1)$ is finite. On the other hand,

$$\lim_{k_0 \rightarrow k} \lim_{n_0 \rightarrow n} \frac{\Gamma(n_0 + 1)}{\Gamma(k_0 + 1)}$$

does not exist, since for non-integral k_0 , $\Gamma(k_0 + 1)$ is finite while $\Gamma(n_0 + 1)$ is unbounded.

However, since for $k \in \mathbf{Z}$, $n \in \mathbf{Z}$ and $0 < k < n$ both definitions agree, one could also combine them. This is what, for example, Mathematica does. It seems that MuPAD sets `binomial(n,n)=1` for all arguments n , and returns `binomial(-2, n)` unevaluated. Provisos may help here.

dvsum and dvdsun

The `dvsum` and `dvdsun` operations implement differentiation of sums with and without bounds. Note that the function

$$n \mapsto \sum_{k=1}^n f(k, n)$$

is well defined only for integral values of n greater than or equal to zero. There is not even consensus how to define this function for $n < 0$. Thus, it is not differentiable. Therefore, we

need to check whether we erroneously are differentiating with respect to the upper bound or the lower bound, where the same reasoning holds.

Differentiating a sum with respect to its indexing variable correctly gives zero. This is due to the introduction of dummy variables in the internal representation of a sum: the operator `%defsum` takes 5 arguments, namely

1. the summands, where each occurrence of the indexing variable is replaced by
2. the dummy variable,
3. the indexing variable,
4. the lower bound, and
5. the upper bound.

dvprod and dvdprod

The `dvprod` and `dvdprod` operations implement differentiation of products with and without bounds. Note again, that we cannot even properly define products with bounds that are not integral.

To differentiate the product, we use Leibniz rule:

$$\frac{d}{dx} \prod_{i=a}^b f(i, x) = \sum_{i=a}^b \frac{\frac{d}{dx} f(i, x)}{f(i, x)} \prod_{i=a}^b f(i, x)$$

There is one situation where this definition might produce wrong results, namely when the product is zero, but axiom failed to recognize it: in this case,

$$\frac{d}{dx} f(i, x) / f(i, x)$$

is undefined for some i . However, I was not able to come up with an example. The alternative definition

$$\frac{d}{dx} \prod_{i=a}^b f(i, x) = \sum_{i=a}^b \left(\frac{d}{dx} f(i, x) \right) \prod_{j=a, j \neq i}^b f(j, x)$$

has the slight (display) problem that we would have to come up with a new index variable, which looks very ugly. Furthermore, it seems to me that more simplifications will occur with the first definition.

```
f := operator 'f
D(product(f(i,x),i=1..m),x)
```

dvpow2

The dvpow2 operation implements the differentiation of the power operator `%power` with respect to its second argument, the exponent. It uses the formula

$$\frac{d}{dx}g(y)^x = \frac{d}{dx}e^{x \log g(y)} = \log g(y)g(y)^x.$$

If $g(y)$ equals zero, this formula is not valid, since the logarithm is not defined there. Although strictly speaking 0^x is not differentiable at zero, we return zero for convenience.

ComplexRootFindingPackage examples

=====

ComplexRootFindingPackage provides functions to find all roots of a polynomial p over the complex number by using Plesken's idea to calculate in the polynomial ring modulo f and employing the Chinese Remainder Theorem.

In this first version, the precision (see digits) is not increased when this is necessary to avoid rounding errors. Hence it is the user's responsibility to increase the precision if necessary.

Note also, if this package is called with, for example, Fraction Integer, the precise calculations could require a lot of time.

Also note that evaluating the zeros is not necessarily a good check whether the result is correct: already evaluation can cause rounding errors.

NNI    ==> NonNegativeInteger
OF     ==> OutputForm
ICF    ==> IntegerCombinatoricFunctions(I)

SIG ==> with

complexZeros : UP -> L C
  ++ complexZeros(p) tries to determine all complex zeros
  ++ of the polynomial p with accuracy given by the package
  ++ constant globalEps which you may change by setErrorBound.

complexZeros : (UP, R) -> L C
  ++ complexZeros(p, eps) tries to determine all complex zeros
  ++ of the polynomial p with accuracy given by eps.

divisorCascade : (UP,UP, Boolean) -> L FAE
  ++ divisorCascade(p,tp) assumes that degree of polynomial tp
  ++ is smaller than degree of polynomial p, both monic.
  ++ A sequence of divisions are calculated
  ++ using the remainder, made monic, as divisor
  ++ for the the next division. The result contains also the error of the
  ++ factorizations, the norm of the remainder polynomial.
  ++ If info is true, then information messages are issued.

divisorCascade : (UP,UP) -> L FAE
  ++ divisorCascade(p,tp) assumes that degree of polynomial tp
  ++ is smaller than degree of polynomial p, both monic.
  ++ A sequence of divisions is calculated
  ++ using the remainder, made monic, as divisor
  ++ for the the next division. The result contains also the error of the
  ++ factorizations, the norm of the remainder polynomial.

factor : (UP,R,Boolean) -> FR UP
  ++ factor(p, eps, info) tries to factor p into linear factors
  ++ with error atmost eps. An overall error bound
  ++ eps0 is determined and iterated tree-like calls
  ++ to pleskenSplit are used to get the factorization.
  ++ If info is true, then information messages are given.

factor : (UP,R) -> FR UP
  ++ factor(p, eps) tries to factor p into linear factors
  ++ with error atmost eps. An overall error bound

```

```

++ eps0 is determined and iterated tree-like calls
++ to pleskenSplit are used to get the factorization.

factor : UP -> FR UP
++ factor(p) tries to factor p into linear factors
++ with error atmost globalEps, the internal error bound,
++ which can be set by setErrorBound. An overall error bound
++ eps0 is determined and iterated tree-like calls
++ to pleskenSplit are used to get the factorization.

graeffe : UP -> UP
++ graeffe p determines q such that \spad{q(-z**2) = p(z)*p(-z)}.
++ Note that the roots of q are the squares of the roots of p.

norm : UP -> R
++ norm(p) determines sum of absolute values of coefficients
++ Note that this function depends on abs.

pleskenSplit : (UP, R, Boolean) -> FR UP
++ pleskenSplit(poly,eps,info) determines a start polynomial start
++ by using "startPolynomial then it increases the exponent
++ n of start ** n mod poly to get an approximate factor of
++ poly, in general of degree "degree poly -1". Then a divisor
++ cascade is calculated and the best splitting is chosen, as soon
++ as the error is small enough.
---++ In a later version we plan
---++ to use the whole information to get a split into more than 2
---++ factors.
++ If info is true, then information messages are issued.

pleskenSplit : (UP, R) -> FR UP
++ pleskenSplit(poly, eps) determines a start polynomial start
++ by using "startPolynomial then it increases the exponent
++ n of start ** n mod poly to get an approximate factor of
++ poly, in general of degree "degree poly -1". Then a divisor
++ cascade is calculated and the best splitting is chosen, as soon
++ as the error is small enough.
---++ In a later version we plan
---++ to use the whole information to get a split into more than 2
---++ factors.

reciprocalPolynomial : UP -> UP
++ reciprocalPolynomial(p) calculates a polynomial which has exactly
++ the inverses of the non-zero roots of p as roots, and the same
++ number of 0-roots.

rootRadius : (UP,R) -> R
++ rootRadius(p,errQuot) calculates the root radius of p with a
++ maximal error quotient of errQuot.

```

```

rootRadius : UP -> R
++ rootRadius(p) calculates the root radius of p with a
++ maximal error quotient of 1+globalEps, where
++ globalEps is the internal error bound, which can be
++ set by setErrorBound.

schwerpunkt : UP -> C
++ schwerpunkt(p) determines the 'Schwerpunkt' of the roots of the
++ polynomial p of degree n, the center of gravity, which is
++ coefficient of \spad{x**(n-1)} divided by
++ n times coefficient of \spad{x**n}.

setErrorBound : R -> R
++ setErrorBound(eps) changes the internal error bound,
-- by default being 10 ** (-20) to eps, if R is
++ by default being 10 ** (-3) to eps, if R is
++ a member in the category \spadtype{QuotientFieldCategory Integer}.
++ The internal globalDigits is set to
++ \em ceiling(1/r)**2*10 being 10**7 by default.

startPolynomial : UP -> Record(start: UP, factors: FR UP)
++ startPolynomial(p) uses the ideas of Schoenhage's
++ variant of Graeffe's method to construct circles which separate
++ roots to get a good start polynomial, one whose
++ image under the Chinese Remainder Isomorphism has both entries
++ of norm smaller and greater or equal to 1. In case the
++ roots are found during internal calculations.
++ The corresponding factors
++ are in factors which are otherwise 1.

CODE ==> add

++ Author: Jim Wen
++ Date Created: 12 March 1990
++ Date Last Updated: 19 June 1990, Clifton J. Williamson
++ Description:
++ CoordinateSystems provides coordinate transformation functions
++ for plotting. Functions in this package return conversion functions
++ which take points expressed in other coordinate systems and return points
++ with the corresponding Cartesian coordinates.

CoordinateSystems(R) : SIG == CODE where
  R : Join(Field,TranscendentalFunctionCategory,RadicalCategory)

Pt ==> Point R

SIG ==> with

  cartesian : Pt -> Pt
    ++ cartesian(pt) returns the Cartesian coordinates of point pt.

  polar : Pt -> Pt
    ++ polar(pt) transforms pt from polar coordinates to Cartesian
    ++ coordinates: the function produced will map the point \spad{(r,theta)}
    ++ to \spad{x = r * cos(theta)} , \spad{y = r * sin(theta)}.

  cylindrical : Pt -> Pt
    ++ cylindrical(pt) transforms pt from polar coordinates to Cartesian
    ++ coordinates: the function produced will map the point

```

```

++ \spad{(r,theta,z)}
++ to \spad{x = r * cos(theta)}, \spad{y = r * sin(theta)}, \spad{z}.

spherical : Pt -> Pt
++ spherical(pt) transforms pt from spherical coordinates to Cartesian
++ coordinates: the function produced will map the point
++ \spad{(r,theta,phi)}
++ to \spad{x = r*sin(phi)*cos(theta)}, \spad{y = r*sin(phi)*sin(theta)},
++ \spad{z = r*cos(phi)}.

parabolic : Pt -> Pt
++ parabolic(pt) transforms pt from parabolic coordinates to Cartesian
++ coordinates: the function produced will map the point \spad{(u,v)} to
++ \spad{x = 1/2*(u**2 - v**2)}, \spad{y = u*v}.

parabolicCylindrical : Pt -> Pt
++ parabolicCylindrical(pt) transforms pt from parabolic cylindrical
++ coordinates to Cartesian coordinates: the function produced will
++ map the point \spad{(u,v,z)} to \spad{x = 1/2*(u**2 - v**2)},
++ \spad{y = u*v}, \spad{z}.

paraboloidal : Pt -> Pt
++ paraboloidal(pt) transforms pt from paraboloidal coordinates to
++ Cartesian coordinates: the function produced will map the point
++ \spad{(u,v,phi)} to \spad{x = u*v*cos(phi)}, \spad{y = u*v*sin(phi)},
++ \spad{z = 1/2 * (u**2 - v**2)}.

elliptic : R -> (Pt -> Pt)
++ elliptic(a) transforms from elliptic coordinates to Cartesian
++ coordinates: \spad{elliptic(a)} is a function which will map the
++ point \spad{(u,v)} to \spad{x = a*cosh(u)*cos(v)},
++ \spad{y = a*sinh(u)*sin(v)}.

ellipticCylindrical : R -> (Pt -> Pt)
++ ellipticCylindrical(a) transforms from elliptic
++ cylindrical coordinates
++ to Cartesian coordinates: \spad{ellipticCylindrical(a)} is a function
++ which will map the point \spad{(u,v,z)} to
++ \spad{x = a*cosh(u)*cos(v)},
++ \spad{y = a*sinh(u)*sin(v)}, \spad{z}.

prolateSpheroidal : R -> (Pt -> Pt)
++ prolateSpheroidal(a) transforms from prolate spheroidal coordinates to
++ Cartesian coordinates: \spad{prolateSpheroidal(a)} is a function
++ which will map the point \spad{(xi,eta,phi)} to
++ \spad{x = a*sinh(xi)*sin(eta)*cos(phi)},
++ \spad{y = a*sinh(xi)*sin(eta)*sin(phi)},
++ \spad{z = a*cosh(xi)*cos(eta)}.

oblateSpheroidal : R -> (Pt -> Pt)

```

```

++ oblateSpheroidal(a) transforms from oblate spheroidal coordinates to
++ Cartesian coordinates: \spad{oblateSpheroidal(a)} is a function which
++ will map the point \spad{(xi,eta,phi)} to
++ \spad{x = a*sinh(xi)*sin(eta)*cos(phi)},
++ \spad{y = a*sinh(xi)*sin(eta)*sin(phi)},
++ \spad{z = a*cosh(xi)*cos(eta)}.

```

```

bipolar : R -> (Pt -> Pt)
++ bipolar(a) transforms from bipolar coordinates
++ to Cartesian coordinates:
++ \spad{bipolar(a)} is a function which will map
++ the point \spad{(u,v)} to
++ \spad{x = a*sinh(v)/(cosh(v)-cos(u))},
++ \spad{y = a*sin(u)/(cosh(v)-cos(u))}.

```

```

bipolarCylindrical : R -> (Pt -> Pt)
++ bipolarCylindrical(a) transforms from bipolar cylindrical coordinates
++ to Cartesian coordinates: \spad{bipolarCylindrical(a)}
++ is a function which
++ will map the point \spad{(u,v,z)} to
++ \spad{x = a*sinh(v)/(cosh(v)-cos(u))},
++ \spad{y = a*sin(u)/(cosh(v)-cos(u))}, \spad{z}.

```

```

toroidal : R -> (Pt -> Pt)
++ toroidal(a) transforms from toroidal coordinates to Cartesian
++ coordinates: \spad{toroidal(a)} is a function which will map the point
++ \spad{(u,v,phi)} to \spad{x = a*sinh(v)*cos(phi)/(cosh(v)-cos(u))},
++ \spad{y = a*sinh(v)*sin(phi)/(cosh(v)-cos(u))},
++ \spad{z = a*sin(u)/(cosh(v)-cos(u))}.

```

```

conical : (R,R) -> (Pt -> Pt)
++ conical(a,b) transforms from conical coordinates
++ to Cartesian coordinates:
++ \spad{conical(a,b)} is a function which will map
++ the point \spad{(lambda,mu,nu)} to
++ \spad{x = lambda*mu*nu/(a*b)},
++ \spad{y = lambda/a*sqrt((mu**2-a**2)*(nu**2-a**2)/(a**2-b**2))},
++ \spad{z = lambda/b*sqrt((mu**2-b**2)*(nu**2-b**2)/(b**2-a**2))}.

CycleIndicators examples

=====

Polya-Redfield enumeration by cycle indices.

This section is based upon the paper J. H. Redfield, ‘‘The Theory of Group-Reduced Distributions’’, American J. Math., 49 (1927) 433-455, and is an application of group theory to enumeration problems. It is a development of the work by P. A. MacMahon on the application of symmetric functions and Hammond operators to combinatorial theory.

The theory is based upon the power sum symmetric functions $s(i)$ which are the sum of the i -th powers of the variables. The cycle index of a permutation is an expression that specifies the sizes of the cycles of a permutation, and may be represented as a partition. A partition of a non-negative integer n is a collection of positive integers called its parts whose sum is n . For example, the partition $(3^2 2 1^2)$ will be used to represent $s^2_3 s_2 s^2_1$ and will indicate that the permutation has two cycles of length 3, one of length 2 and two of length 1. The cycle index of a permutation group is the sum of the cycle indices of its permutations divided by the number of permutations. The cycle indices of certain groups are provided.

The operation `complete` returns the cycle index of the symmetric group of order n for argument n . Alternatively, it is the n -th complete homogeneous symmetric function expressed in terms of power sum symmetric functions.

complete 1
(1)

Type: SymmetricPolynomial Fraction Integer

complete 2

$$\frac{1}{2} (2) + \frac{1}{2} (1)^2$$

Type: SymmetricPolynomial Fraction Integer

complete 3

$$-\frac{1}{3}(3) + \frac{1}{2}(2\ 1) + \frac{1}{6}(1\ 3)$$

Type: SymmetricPolynomial Fraction Integer

complete 7

$$\begin{aligned} & -\frac{1}{7}(7) + \frac{1}{6}(6\ 1) + \frac{1}{10}(5\ 2) + \frac{1}{10}(5\ 1\ 1) + \frac{2}{12}(4\ 3) + \frac{1}{8}(4\ 2\ 1) + \frac{1}{24}(4\ 1\ 1\ 1) \\ & + \frac{1}{18}(3\ 1\ 1) + \frac{2}{24}(3\ 2) + \frac{1}{12}(3\ 2\ 1) + \frac{2}{72}(3\ 1\ 1\ 1) + \frac{4}{48}(2\ 1\ 1\ 1) + \frac{3}{48}(2\ 1\ 1\ 1\ 1) \\ & + \frac{1}{240}(2\ 1\ 1\ 1\ 1\ 1) + \frac{5}{5040}(1\ 1\ 1\ 1\ 1\ 1\ 1) \end{aligned}$$

Type: SymmetricPolynomial Fraction Integer

The operation elementary computes the n-th elementary symmetric function for argument n.

elementary 7

$$\begin{aligned} & -\frac{1}{7}(7) - \frac{1}{6}(6\ 1) - \frac{1}{10}(5\ 2) + \frac{1}{10}(5\ 1\ 1) - \frac{2}{12}(4\ 3) + \frac{1}{8}(4\ 2\ 1) - \frac{1}{24}(4\ 1\ 1\ 1) \\ & + \frac{1}{18}(3\ 1\ 1) + \frac{2}{24}(3\ 2) - \frac{1}{12}(3\ 2\ 1) + \frac{2}{72}(3\ 1\ 1\ 1) - \frac{4}{48}(2\ 1\ 1\ 1) + \frac{3}{48}(2\ 1\ 1\ 1\ 1) \\ & - \frac{1}{240}(2\ 1\ 1\ 1\ 1\ 1) + \frac{5}{5040}(1\ 1\ 1\ 1\ 1\ 1\ 1) \end{aligned}$$

Type: SymmetricPolynomial Fraction Integer

The operation alternating returns the cycle index of the alternating group having an even number of even parts in each cycle partition.

alternating 7

$$\begin{aligned} & -\frac{2}{7}(7) + \frac{1}{5}(5\ 1) + \frac{2}{4}(4\ 2) + \frac{1}{9}(3\ 1\ 1) + \frac{2}{12}(3\ 2) + \frac{1}{36}(3\ 1\ 1\ 1) + \frac{4}{24}(2\ 1\ 1\ 1) \\ & + \frac{1}{2520}(1\ 1\ 1\ 1\ 1\ 1\ 1) \end{aligned}$$

Type: SymmetricPolynomial Fraction Integer

The operation cyclic returns the cycle index of the cyclic group.

```
cyclic 7
  6      1      7
- (7) + - (1 )
  7      7
Type: SymmetricPolynomial Fraction Integer
```

The operation `dihedral` is the cycle index of the dihedral group.

```
dihedral 7
  3      1      3      1      7
- (7) + - (2 1) + -- (1 )
  7      2      14
Type: SymmetricPolynomial Fraction Integer
```

The operation `graphs` for argument `n` returns the cycle index of the group of permutations on the edges of the complete graph with `n` nodes induced by applying the symmetric group to the nodes.

```
graphs 5
  1      1      2      1      2      1      3      1      4      2      1      3      4      1      10
- (6 3 1) + - (5 ) + - (4 2) + - (3 1) + - (2 1 ) + -- (2 1 ) + --- (1 )
  6      5      4      6      8      12      120
Type: SymmetricPolynomial Fraction Integer
```

The cycle index of a direct product of two groups is the product of the cycle indices of the groups. Redfield provided two operations on two cycle indices which will be called "cup" and "cap" here. The cup of two cycle indices is a kind of scalar product that combines monomials for permutations with the same cycles. The cap operation provides the sum of the coefficients of the result of the cup operation which will be an integer that enumerates what Redfield called group-reduced distributions.

We can, for example, represent complete 2 * complete 2 as the set of objects `a a b b` and complete 2 * complete 1 * complete 1 as `c c d e`.

This integer is the number of different sets of four pairs.

```
cap(complete 2**2, complete 2*complete 1**2)
  4
Type: Fraction Integer
```

For example,

```
a a b b      a a b b      a a b b      a a b b
c c d e      c d c e      c e c d      d e c c
```

This integer is the number of different sets of four pairs no two pairs being equal.

```
cap(elementary 2**2, complete 2*complete 1**2)
2
```

Type: Fraction Integer

For example,

```
a a b b    a a b b
c d c e    c e c d
```

In this case the configurations enumerated are easily constructed, however the theory merely enumerates them providing little help in actually constructing them.

Here are the number of 6-pairs, first from a a a b b c, second from d d e e f g.

```
cap(complete 3*complete 2*complete 1,complete 2**2*complete 1**2)
24
```

Type: Fraction Integer

Here it is again, but with no equal pairs.

```
cap(elementary 3*elementary 2*elementary 1,complete 2**2*complete 1**2)
8
```

Type: Fraction Integer

```
cap(complete 3*complete 2*complete 1,elementary 2**2*elementary 1**2)
8
```

Type: Fraction Integer

The number of 6-triples, first from a a a b b c, second from d d e e f g, third from h h i i j j.

```
eval(cup(complete 3*complete 2*complete 1, cup(complete 2**2*complete 1**2,complete 2**3)))
1500
```

Type: Fraction Integer

The cycle index of vertices of a square is dihedral 4.

```
square:=dihedral 4
1      3 2      1      2      1      4
- (4) + - (2 ) + - (2 1 ) + - (1 )
4      8      4      8
```

Type: SymmetricPolynomial Fraction Integer

The number of different squares with 2 red vertices and 2 blue vertices.

```
cap(complete 2**2,square)
2
```

Type: Fraction Integer

The number of necklaces with 3 red beads, 2 blue beads and 2 green beads.

```
cap(complete 3*complete 2**2,dihedral 7)
18
Type: Fraction Integer
```

The number of graphs with 5 nodes and 7 edges.

```
cap(graphs 5,complete 7*complete 3)
4
Type: Fraction Integer
```

The cycle index of rotations of vertices of a cube.

```
s(x) == powerSum(x)
Type: Void

cube:=(1/24)*(s 1**8+9*s 2**4 + 8*s 3**2*s 1**2+6*s 4**2)
1 2 1 2 2 3 4 1 8
- (4 ) + - (3 1 ) + - (2 ) + -- (1 )
4 3 8 24
Type: SymmetricPolynomial Fraction Integer
```

The number of cubes with 4 red vertices and 4 blue vertices.

```
cap(complete 4**2,cube)
7
Type: Fraction Integer
```

The number of labeled graphs with degree sequence 2 2 2 1 1 with no loops or multiple edges.

```
cap(complete 2**3*complete 1**2,wreath(elementary 4,elementary 2))
7
Type: Fraction Integer
```

Again, but with loops allowed but not multiple edges.

```
cap(complete 2**3*complete 1**2,wreath(elementary 4,complete 2))
17
Type: Fraction Integer
```

Again, but with multiple edges allowed, but not loops

```
cap(complete 2**3*complete 1**2,wreath(complete 4,elementary 2))
10
Type: Fraction Integer
```

Again, but with both multiple edges and loops allowed

```
cap(complete 2**3*complete 1**2,wreath(complete 4,complete 2))
23
```

Type: Fraction Integer

Having constructed a cycle index for a configuration we are at liberty to evaluate the s_i components any way we please. For example we can produce enumerating generating functions. This is done by providing a function f on an integer i to the value required of s_i , and then evaluating $\text{eval}(f, \text{cycleindex})$.

```
x: ULS(FRAC INT, 'x, 0) := 'x
x
Type: UnivariateLaurentSeries(Fraction Integer, x, 0)
```

```
ZeroOrOne: INT -> ULS(FRAC INT, 'x, 0)
Type: Void
```

```
Integers: INT -> ULS(FRAC INT, 'x, 0)
Type: Void
```

For the integers 0 and 1, or two colors.

```
ZeroOrOne n == 1+x**n
Type: Void

ZeroOrOne 5
5
1 + x
Type: UnivariateLaurentSeries(Fraction Integer, x, 0)
```

For the integers 0, 1, 2, ... we have this.

```
Integers n == 1/(1-x**n)
Type: Void

Integers 5
5      10      11
1 + x  + x  + 0(x )
Type: UnivariateLaurentSeries(Fraction Integer, x, 0)
```

The coefficient of x^n is the number of graphs with 5 nodes and n edges.

Note that there is an `eval` function that takes two arguments. It has the signature:

```
((Integer -> D1), SymmetricPolynomial Fraction Integer) -> D1
from EvaluateCycleIndicators D1 if D1 has ALGEBRA FRAC INT
```

This function is not normally exposed (it will not normally be considered

in the list of eval functions) as it is only useful for this particular domain. To use it we ask that it be considered thus:

```
)expose EVALCYC
```

and now we can use it:

```
eval(ZeroOrOne, graphs 5)
      2      3      4      5      6      7      8      9      10      11
1 + x + 2x + 4x + 6x + 6x + 4x + 2x + x + x + 0(x )
      Type: UnivariateLaurentSeries(Fraction Integer,x,0)
```

The coefficient of x^n is the number of necklaces with n red beads and $n-8$ green beads.

```
eval(ZeroOrOne,dihedral 8)
      2      3      4      5      6      7      8
1 + x + 4x + 5x + 8x + 5x + 4x + x + x
      Type: UnivariateLaurentSeries(Fraction Integer,x,0)
```

The coefficient of x^n is the number of partitions of n into 4 or fewer parts.

```
eval(Integers,complete 4)
      2      3      4      5      6      7      8      9      10      11
1 + x + 2x + 3x + 5x + 6x + 9x + 11x + 15x + 18x + 23x + 0(x )
      Type: UnivariateLaurentSeries(Fraction Integer,x,0)
```

The coefficient of x^n is the number of partitions of n into 4 boxes containing ordered distinct parts.

```
eval(Integers,elementary 4)
      6      7      8      9      10      11      12      13      14      15      16
x + x + 2x + 3x + 5x + 6x + 9x + 11x + 15x + 18x + 23x
+
      17
0(x )
      Type: UnivariateLaurentSeries(Fraction Integer,x,0)
```

The coefficient of x^n is the number of different cubes with n red vertices and $8-n$ green ones.

```
eval(ZeroOrOne,cube)
      2      3      4      5      6      7      8
1 + x + 3x + 3x + 7x + 3x + 3x + x + x
      Type: UnivariateLaurentSeries(Fraction Integer,x,0)
```

The coefficient of x^n is the number of different cubes with integers on the vertices whose sum is n .

```
eval(Integers,cube)
```

```

      2      3      4      5      6      7      8      9      10
1 + x + 4x + 7x + 21x + 37x + 85x + 151x + 292x + 490x + 848x
+
      11
0(x )
Type: UnivarianteLaurentSeries(Fraction Integer,x,0)

```

The coefficient of x^n is the number of graphs with 5 nodes and with integers on the edges whose sum is n . In other words, the enumeration is of multigraphs with 5 nodes and n edges.

```

eval(Integers,graphs 5)
      2      3      4      5      6      7      8      9      10
1 + x + 3x + 7x + 17x + 35x + 76x + 149x + 291x + 539x + 974x
+
      11
0(x )
Type: UnivarianteLaurentSeries(Fraction Integer,x,0)

```

Graphs with 15 nodes enumerated with respect to number of edges.

```

eval(ZeroOrOne ,graphs 15)
      2      3      4      5      6      7      8      9      10
1 + x + 2x + 5x + 11x + 26x + 68x + 177x + 496x + 1471x + 4583x
+
      11
0(x )
Type: UnivarianteLaurentSeries(Fraction Integer,x,0)

```

Necklaces with 7 green beads, 8 white beads, 5 yellow beads and 10 red beads.

```

cap(dihedral 30,complete 7*complete 8*complete 5*complete 10)
49958972383320
Type: Fraction Integer

```

The operation `SFunction` is the S-function or Schur function of a partition written as a descending list of integers expressed in terms of power sum symmetric functions.

In this case the argument partition represents a tableau shape. For example `3,2,2,1` represents a tableau with three boxes in the first row, two boxes in the second and third rows, and one box in the fourth row. `SFunction [3,2,2,1]` counts the number of different tableaux of shape `3, 2, 2, 1` filled with objects with an ascending order in the columns and a non-descending order in the rows.

```

sf3221:= SFunction [3,2,2,1]
      1      1      2      1      2      1      1      4      1      2
-- (6 2) - -- (6 1 ) - -- (4 ) + -- (4 3 1) + -- (4 1 ) - -- (3 2)

```

$$\begin{aligned}
& \frac{12}{36} + \frac{12}{24} + \frac{16}{36} + \frac{12}{72} + \frac{24}{192} + \frac{36}{48} \\
& + \frac{1}{96} \frac{2}{144} \frac{2}{576} - \frac{1}{36} \frac{2}{144} \frac{1}{576} - \frac{1}{36} \frac{2}{144} \frac{1}{576} - \frac{1}{36} \frac{2}{144} \frac{1}{576} - \frac{1}{36} \frac{2}{144} \frac{1}{576} - \frac{1}{36} \frac{2}{144} \frac{1}{576} \\
& + \frac{1}{96} \frac{2}{144} \frac{2}{576} - \frac{1}{36} \frac{2}{144} \frac{1}{576} - \frac{1}{36} \frac{2}{144} \frac{1}{576} - \frac{1}{36} \frac{2}{144} \frac{1}{576} - \frac{1}{36} \frac{2}{144} \frac{1}{576} - \frac{1}{36} \frac{2}{144} \frac{1}{576}
\end{aligned}$$

Type: SymmetricPolynomial Fraction Integer

This is the number filled with a a b b c c d d.

```
cap(sf3221,complete 2**4)
3
Type: Fraction Integer
```

The configurations enumerated above are:

a a b	a a c	a a d
b c	b b	b b
c d	c d	c c
d	d	d

This is the number of tableaux filled with 1..8.

```
cap(sf3221, powerSum 1**8)
70
Type: Fraction Integer
```

The coefficient of x^n is the number of column strict reverse plane partitions of n of shape 3 2 2 1.

```
eval(Integers, sf3221)
9      10      11      12      13      14      15      16      17

++\spad{complete n} is the \spad{n} th complete homogeneous
++ symmetric function expressed in terms of power sums.
++ Alternatively it is the cycle index of the symmetric
++ group of degree n.

powerSum : I -> SPOL RN
++\spad{powerSum n} is the \spad{n} th power sum symmetric
++ function.

elementary : I -> SPOL RN
++\spad{elementary n} is the \spad{n} th elementary symmetric
++ function expressed in terms of power sums.

alternating : I -> SPOL RN
++\spad{alternating n} is the cycle index of the
++ alternating group of degree n.

cyclic : I -> SPOL RN    --cyclic group
++\spad{cyclic n} is the cycle index of the
++ cyclic group of degree n.

dihedral : I -> SPOL RN    --dihedral group
++\spad{dihedral n} is the cycle index of the
++ dihedral group of degree n.

graphs : I -> SPOL RN
++\spad{graphs n} is the cycle index of the group induced on
++ the edges of a graph by applying the symmetric function to the
++ n nodes.

cap : (SPOL RN,SPOL RN) -> RN
++\spad{cap(s1,s2)}, introduced by Redfield,
++ is the scalar product of two cycle indices.

cup : (SPOL RN,SPOL RN) -> SPOL RN
++\spad{cup(s1,s2)}, introduced by Redfield,
++ is the scalar product of two cycle indices, in which the
++ power sums are retained to produce a cycle index.

eval : SPOL RN -> RN

```

```

++\spad{eval s} is the sum of the coefficients of a cycle index.

wreath : (SPOL RN, SPOL RN) -> SPOL RN
++\spad{wreath(s1,s2)} is the cycle index of the wreath product
++ of the two groups whose cycle indices are \spad{s1} and
++ \spad{s2}.

SFunction : L I -> SPOL RN
++\spad{SFunction(li)} is the S-function of the partition \spad{li}
++ expressed in terms of power sum symmetric functions.

skewSFunction : (L I, L I) -> SPOL RN
++\spad{skewSFunction(li1,li2)} is the S-function
++ of the partition difference \spad{li1 - li2}
++ expressed in terms of power sum symmetric functions.

DiophantineSolutionPackage examples
=====

```

Any solution of a homogeneous linear Diophantine equation can be represented as a sum of minimal solutions, which form a "basis" (a minimal solution cannot be represented as a nontrivial sum of solutions) in the case of an inhomogeneous linear Diophantine equation, each solution is the sum of a inhomogeneous solution and any number of homogeneous solutions therefore, it suffices to compute two sets:

1. all minimal inhomogeneous solutions
2. all minimal homogeneous solutions

the algorithm implemented is a completion procedure, which enumerates all solutions in a recursive depth-first-search it can be seen as finding monotone paths in a graph for more details see Reference

separateFactors : List fact -> List FP
  ++ separateFactors(lfact) takes the list produced by separateDegrees
  ++ and produces the complete list of factors.

exptMod : (FP, NNI, FP) -> FP
  ++ exptMod(u, k, v) raises the polynomial u to the kth power
  ++ modulo the polynomial v.

trace2PowMod : (FP, NNI, FP) -> FP
  ++ trace2PowMod(u, k, v) produces the sum of u**(2**i) for i running
  ++ from 1 to k all computed modulo the polynomial v.

tracePowMod : (FP, NNI, FP) -> FP
  ++ tracePowMod(u, k, v) produces the sum of \spad{u**(q**i)}
  ++ for i running and q= size F

irreducible? : FP -> Boolean
  ++ irreducible?(p) tests whether the polynomial p is irreducible.

package DFSFUN DoubleFloatSpecialFunctions

The special functions in this section are developed as special cases but can all be expressed in terms of generalized hypergeometric functions ${}_pF_q$ or its generalization, the Meijer G function. [Luke69a, Luke69b] The long term plan is to reimplement these functions using the generalized version.

=====

DoubleFloatSpecialFunctions examples

=====

This package provides special functions for double precision
real and complex floating point.

The formula used will agree with the Table of the Fresnel Integral
by Pearcey (1959) to 6 decimal places up to an argument of about 35.0.

After that the summation gets slowly worse, agreeing to only 2 digits at about 45.0.

```
fresnelC(1.5)
0.7790837385 0396370968
```

```
fresnelS(1.5)
0.4154833182 6565542581
```

++ Description:
++ This package provides special functions for double precision
++ real and complex floating point.

DoubleFloatSpecialFunctions() : SIG == CODE where

NNI ==> NonNegativeInteger
PI  ==> Integer
R   ==> DoubleFloat
C   ==> Complex DoubleFloat
OPR ==> OnePointCompletion R
F   ==> Float
LF  ==> List Float

SIG ==> with

Gamma : R -> R
++ Gamma(x) is the Euler gamma function, \spad{Gamma(x)}, defined by
++ \spad{Gamma(x) = integrate(t^(x-1)*exp(-t), t=0..%infinity)}.

Gamma : C -> C
++ Gamma(x) is the Euler gamma function, \spad{Gamma(x)}, defined by
++ \spad{Gamma(x) = integrate(t^(x-1)*exp(-t), t=0..%infinity)}.

E1 : R -> OPR
++ E1(x) is the Exponential Integral function
++ The current implementation is a piecewise approximation
++ involving one poly from -4..4 and a second poly for x > 4

En : (PI,R) -> OPR
++ En(n,x) is the nth Exponential Integral Function

Ei : (OPR) -> OPR
++ Ei(opr) is the Exponential Integral function
++ This is computed using a 6 part piecewise approximation.
++ DoubleFloat can only preserve about 16 digits but the
++ Chebyshev approximation used can give 30 digits.

Ei1 : (OPR) -> OPR
++ Ei1(opr) is the first approximation of Ei where the result is
++ x*%e^-x*Ei(x) from -infinity to -10 (preserves digits)

Ei2 : (OPR) -> OPR
++ Ei2(opr) is the first approximation of Ei where the result is
++ x*%e^-x*Ei(x) from -10 to -4 (preserves digits)

```

```

Ei3 : (OPR) -> OPR
++ Ei3(opr) is the first approximation of Ei where the result is
++ (Ei(x)-log |x| - gamma)/x from -4 to 4 (preserves digits)

Ei4 : (OPR) -> OPR
++ Ei4(opr) is the first approximation of Ei where the result is
++ x*%e^-x*Ei(x) from 4 to 12 (preserves digits)

Ei5 : (OPR) -> OPR
++ Ei5(opr) is the first approximation of Ei where the result is
++ x*%e^-x*Ei(x) from 12 to 32 (preserves digits)

Ei6 : (OPR) -> OPR
++ Ei6(opr) is the first approximation of Ei where the result is
++ x*%e^-x*Ei(x) from 32 to infinity (preserves digits)

Beta : (R, R) -> R
++ Beta(x, y) is the Euler beta function, \spad{B(x,y)}, defined by
++ \spad{Beta(x,y) = integrate(t^(x-1)*(1-t)^(y-1), t=0..1)}.

The Exponential Integral

The E1 function

(Quoted from Segletes[Seg198]):

A number of useful integrals exist for which no exact solutions have been found. In other cases, an exact solution, if found, may be impractical to utilize over the complete domain of the function because of precision limitations associated with what usually ends up as a series solution to the challenging integral. For many of these integrals, tabulated values may be published in various mathematical handbooks and articles. In some handbooks, fits (usually piecewise) also are offered. In some cases, an application may be forced to resort to numerical integration in order to acquire the integrated function. In this context, compact (not piecewise) analytical fits to some of these problematic integrals, accurate to within a small fraction of the numerically integrated value, serve as a useful tool to applications requiring the results of the integration, especially when the integration is required numerous times throughout the course of the application. Furthermore, the ability and methodology to develop intelligent fits, in contrast to the more traditional “brute force” fits, provide the means to minimize parameters and maximize accuracy when tackling some of these difficult functions. The exponential integral will be used as an opportunity to both demonstrate a methodology for intelligent fitting as well as for providing an accurate, compact, analytical fit to the exponential integral.

The exponential integral is a useful class of functions that arise in a variety of applications [...]. The real branch of the family of exponential integrals may be defined as

$$E_n(x) = x^{n-1} \int_x^\infty \frac{e^{-t}}{t^n} dt \quad (5.1)$$

where n , a positive integer, denotes the specific member of the exponential integral family. The argument of the exponential integral, rather than expressing a lower limit of integration as in (1), may be thought of as describing the exponential decay constant, as given in this equivalent (and perhaps more popular) definition of the integral:

$$E_n(x) = \int_1^\infty \frac{e^{-xt}}{t^n} dt \quad (5.2)$$

Integration by parts permits any member of the exponential integral family to be converted to an adjacent member of the family, by way of

$$\int_x^\infty \frac{e^{-t}}{t^{n+1}} dt = \frac{1}{n} \left(\frac{e^{-x}}{x^n} - \int_x^\infty \frac{e^{-t}}{t^n} dt \right) \quad (5.3)$$

expressable in terms of E_n as

$$E_{n+1}(x) = \frac{1}{n} [e^{-x} - xE_n(x)] \quad (n = 1, 2, 3) \quad (5.4)$$

Through recursive employment of this equation, all members of the exponential integral family may be analytically related. However, this technique only allows for the transformation of one integral into another. There remains the problem of evaluating $E_1(x)$. There is an exact solution to the integral of (e^{-t}/t) , appearing in a number of mathematical references which is obtainable by expanding the exponential into a power series and integrating term by term. That exact solution, which is convergent, may be used to specify $E_1(x)$ as

$$E_1(x) = -\gamma - \ln(x) + \frac{x}{1!} - \frac{x^2}{2 \cdot 2!} + \frac{x^3}{3 \cdot 3!} - \dots \quad (5.5)$$

Euler's constant, γ , equal to $0.57721\dots$, arises when the power series expansion for (e^{-t}/t) is integrated and evaluated at its upper limit, as $x \rightarrow \infty$.

Employing eqn (5), however, to evaluate $E_1(x)$ is problematic for finite x significantly larger than unity. One may well ask of the need to evaluate the exponential integral for large x , since the function to be integrated drops off so rapidly that the integral is surely a very flat function. Such reasoning is true when comparing the integrand at large x to that at small x . However, the definition of eqn (1) has as its upper limit not a small value of x , but rather that of ∞ . Therefore, the actual values for $E_n(x)$ are extremely small numbers for large values of x . Thus, it is not sufficient merely to select enough terms of eqn (5) to evaluate the integral to within a value of, for example ± 0.0001 because the actual integral value for large x would be smaller than this arbitrary tolerance. To draw an analogy, it would be like saying that it is good enough to approximate e^{-x} as 0.0 for $x > 10$, since its actual value is within 0.0001 of zero. For some applications, such an approximation may be warranted. In general, though, such an approximation is mathematically unacceptable. Worse yet, as seen from eqns (1) and (2), the need to evaluate the exponential integral for large arguments can arise in real-world problems from either a large integration limit or a large value of an exponential decay constant. Thus, the need to evaluate exponential integrals for large values of the argument is established. It is here that the practical problems with the evaluation of eqn (5) become manifest.

First, the number of terms, N , required to achieve convergence rises rapidly with increasing x , making the summation an inefficient tool, even when expressed as a recursion relation (for three digits of accuracy, N is observed to vary roughly as $9 + 1.6x$, for $1 < x < 7$). More important, however, is the fact that, for calculations of finite precision, the accuracy of the complete summation will be governed by the individual term of greatest magnitude. The source of the problem is that as x is increased, the total summation decreases in magnitude more rapidly than a decaying exponential, while at the same time, the largest individual term in the series is observed to grow rapidly with increasing x (10^1 for $x = 7$, 10^2 for $x = 10$, 10^3 for $x = 13$, etc.). The magnitude of this largest individual term consumes the available precision and, as a result, leaves little or none left for the ever-diminishing net sum that constitutes the desired integral.

Literally, the use of eqn (5), even with (32-bit) double precision, does not permit the exponential integral to be evaluated to three places for $x > 14$ in any case, and with the situation worsening for lesser precision. For these reasons, the use of eqn (5) to evaluate the

exponential integral numerically for large x is wholly unsuitable.

$$E_1(x) = e^{-x} \cdot \frac{1}{x + \frac{1}{1 + \frac{1}{x + \frac{2}{1 + \frac{2}{x + \dots}}}}} \quad (5.6)$$

But as x becomes smaller, the number of terms required for convergence rises quickly. Similar arguments apply for the use of an asymptotic expansion for E_1 , which also converges for large x . As such, the more typical approach employed by handbooks is that of a fit. While some steps are taken to make the fits intelligent, (for example, transformation of variables), the fits are all piecewise over the domain of the integral.

Cody and Thatcher performed what is perhaps the definitive work, with the use of Chebyshev approximations to the exponential integral E_1 . Like others, they fit the integral over a piecewise series of subdomains (three in their case) and provide the fitting parameters necessary to evaluate the function to various required precisions, down to relative errors of 10^{-20} . One of the problems with piecewise fitting over two or more subdomains is that functional value and derivatives of the spliced fits will not, in general, match at the domain transition point, unless special accommodations are made. This sort of discontinuity in functional value and/or slope, curvature, *etc.*, may cause difficulties for some numerical algorithms operating upon the fitted function. Numerical splicing/smoothing algorithms aimed at eliminating discontinuities in the value and/or derivatives of a piecewise fit are not, in general, computationally insignificant. Problems associated with piecewise splicing of fits may also be obviated by obtaining an accurate enough fit, such that the error is on the order of magnitude of the limiting machine precision. This alternative, however, requires the use of additional fitting parameters to acquire the improved precision. Thus, regardless of approach, the desire to eliminate discontinuities in the function and its derivatives, between piecewise splices, requires extra computational effort. One final benefit to be had by avoiding the use of piecewise fits is the concomitant avoidance of conditional (`, IF...THEN`) programming statements in the coding of the routine. The use of conditional statements can preclude maximum computing efficiency on certain parallel computing architectures.

Segletes constructs an analytic, non-piecewise fit to the Exponential Integral but the precision is on the order of 4 decimal places and is not sufficient to compare against the Abramowitz and Stegun Handbook.

Instead we have chosen to use a two piece fitting function based on the Chebyshev polynomial for computing E_1 . This agrees with the handbook values to almost the last published digit. See the `e1.input` pamphlet for regression testing against the handbook tables.

E1:R→OPR

The special function E1 below was originally derived from a function written by T.Haavie as the `expint.c` function in the Numlibc library by Lars Erik Lund. Haavie approximates

the E1 function by two Chebyshev polynomials. For the range $-4 < x < 4$ the Chebyshev coefficients are:

```
7.8737715392882774, -8.0314874286705335, 3.8797325768522250,
-1.6042971072992259, 0.5630905453891458, -0.1704423017433357,
0.0452099390015415, -0.0106538986439085, 0.0022562638123478,

-0.0000000041611418, 0.0000000004821606, -0.0000000000528465,
0.0000000000054945, -0.0000000000005433, 0.0000000000000512,
-0.0000000000000046, 0.0000000000000004
```

and for the range $x > 4$ the Chebyshev coefficients are:

```
0.2155283776715125, 0.1028106215227030, -0.0045526707131788,
0.0003571613122851, -0.0000379341616932, 0.0000049143944914,
-0.0000007355024922, 0.0000001230603606, -0.0000000225236907,
0.0000000044412375, -0.0000000009328509, 0.0000000002069297,
-0.0000000000481502, 0.0000000000116891, -0.0000000000029474,
0.0000000000007691, -0.0000000000002070, 0.0000000000000573,
-0.0000000000000163, 0.0000000000000047, -0.0000000000000014,
0.0000000000000004, -0.0000000000000001
```

I've rewritten the polynomial to use precomputed coefficients that take into account the scaling used by Haavie. I've also rewritten the polynomial using Horner's method so the large powers of x are only computed once.

The result can be either a double float or, or if the argument is zero, infinity. Thus we need to extend the result to be a one-point completion to include infinity.

```

The Ei Function

This function is based on Kin L. Lee's work.

Abstract

The exponential integral $Ei(x)$ is evaluated via Chebyshev series expansion of its associated functions to achieve high relative accuracy throughout the entire real line. The Chebyshev coefficients for these functions are given to 30 significant digits. Clenshaw's method is modified to furnish an efficient procedure for the accurate solution of linear systems having near-triangular coefficient matrices.

Introduction

The evaluation of the exponential integral

$$Ei(x) = \int_{-\infty}^x \frac{e^u}{u} du = -E_1(-x), x \neq 0 \quad (5.7)$$

is usually based on the value of its associated functions, for example, $xe^{-x}Ei(x)$. High accuracy tabulations of integral (1) by means of Taylor series techniques are given by Harris and Miller and Hurst. The evaluation of $Ei(x)$ for $-4 \leq x \leq \infty$ by means of Chebyshev series is provided by Clenshaw to have the absolute accuracy of 20 decimal places. The evaluation of the same integral (1) by rational approximation of its associated functions is furnished by Cody and Thacher for $-\infty < x < \infty$, and has the relative accuracy of 17 significant figures.

The approximation of Cody and Thacher from the point of view of efficient function evaluation are preferable to those of Clenshaw. However, the accuracy of the latter's procedure, unlike those of the former, is not limited by the accuracy or the availability of a master function, which is a means of explicitly evaluating the function in question.

In this paper $Ei(x)$ (or equivalently $-E_1(-x)$) for the entire real line is evaluated via Chebyshev series expansion of its associated functions that are accurate to 30 significant figures by a modification of Clenshaw's procedure. To verify the accuracy of the several Chebyshev series, values of the associated functions were checked against those computed by Taylor series and those of Murnaghan and Wrench (see Remarks on Convergence and Accuracy).

Although for most purposes fewer than 30 figures of accuracy are required, such high accuracy is desirable for the following reasons. In order to further reduce the number of arithmetical operations in the evaluation of a function, the Chebyshev series in question can either be converted into a rational function or rearranged into an ordinary polynomial. Since several figures may be lost in either of these procedures, it is necessary to provide the Chebyshev series with a sufficient number of figures to achieve the desired accuracy. Furthermore, general function approximation routines, such as those used for minimax rational function approximations, require the explicit evaluation of the function to be approximated. To take account of the errors committed by these routines, the function values must have an accuracy higher than the approximation to be determined. Consequently, high-precision results are useful as a master function for finding approximations for (or involving) $Ei(x)$ where prescribed accuracy is less than 30 figures.

Discussion

It is proposed here to provide for the evaluation of $Ei(x)$ by obtaining Chebyshev coefficients for the associated functions given by table 1.

Table 1: Associated Functions of $Ei(x)$ and their ranges of Chebyshev Series Expansions

	Associated function	Range of expansion
Ei1	$xe^{-x}Ei(x)$	$-\infty < x \leq -10$
Ei2	$xe^{-x}Ei(x)$	$-10 \leq x \leq -4$
Ei3	$\frac{Ei(x) - \log x - \gamma}{x}$	$-4 \leq x \leq d42$
Ei4	$xe^{-x}Ei(x)$	$4 \leq x \leq 12$
Ei5	$xe^{-x}Ei(x)$	$12 \leq x \leq 32$
Ei6	$xe^{-x}Ei(x)$	$32 \leq x < \infty$

($\gamma = 0.5772156649\dots$ is Euler's constant.)

Note that the functions $[Ei(x) - \log|x| - \gamma]/x$ and $xe^{-x}Ei(x)$ have the limiting values of unity at the origin and at infinity, respectively, and that the range of the associated function values is close to unity (see table 4). This makes for the evaluation of the associated functions over the indicated ranges in table 1 (and thus $Ei(x)$ over the entire real line) with high relative accuracy by means of the Chebyshev series. The reason for this will become apparent later.

Some remarks about the choice of the intervals of expansion for the several Chebyshev series are in order here. The partition of the real line indicated by table 1 is chosen to allow for the approximation of the associated functions with a maximum error of 0.5×10^{-30} by polynomials of degree < 50 . The real line has also been partitioned with the objective of providing the interval about zero with the lowest degree of polynomial approximation of the six intervals. This should compensate for the computation of $\log|x|$ required in the evaluation of $Ei(x)$ over that interval. The ranges $-\infty < x \leq -4$ and $4 \leq x < \infty$ are partitioned into 2 and 3 intervals, respectively, to provide approximations to $xe^{-x}Ei(x)$ by polynomials of about the same degree.

Expansions in Chebyshev Series

Let $\phi(t)$ be a differentiable function defined on $[-1, 1]$. To facilitate discussion, denote its Chebyshev series and that of its derivative by

$$\phi(t) = \sum_{k=0}^{\infty} {}'A_k^{(0)} T_k(t) \quad \phi'(t) = \sum_{k=0}^{\infty} {}'A_k^{(1)} T_k(t) \quad (5.8)$$

where $T_k(t)$ are Chebyshev polynomials defined by

$$T_k(t) = \cos(k \arccos t), \quad -1 \leq t \leq 1 \quad (5.9)$$

(A prime over a summation sign indicates that the first term is to be halved.)

If $\phi(t)$ and $\phi'(t)$ are continuous, the Chebyshev coefficients $A_k^{(0)}$ and $A_k^{(1)}$ can be obtained analytically (if possible) or by numerical quadrature. However, since each function in table 1 satisfies a linear differential equation with polynomial coefficients, the Chebyshev coefficients can be more readily evaluated by the method of Clenshaw.

There are several variations of Clenshaw's procedure, but for high-precision computation, where multiple precision arithmetic is employed, we find his original procedure easiest to implement. However, straightforward application of it may result in a loss of accuracy if the trial solutions selected are not sufficiently independent. How the difficulty is overcome will be pointed out subsequently.

The function $xe^{-x}Ei(x)$ on the Finite Interval

We consider first the Chebyshev series expansion of

$$f(x) = xe^{-x}Ei(x), \quad (a \leq x \leq b) \quad (5.10)$$

with $x \neq 0$. One can easily verify that after the change of variables

$$x = [(b-a)T + a + b]/2, \quad (-1 \leq t \leq 1) \quad (5.11)$$

the function

$$\phi(t) = f\left[\frac{(b-a)t + a + b}{2}\right] = f(x) \quad (5.12)$$

satisfies the differential equation

$$2(pt+q)\phi'(t) + p(pt+q-2)\phi(t) = p(pt+q) \quad (5.13)$$

with¹

$$\phi(-1) = ae^{-a}Ei(a) \quad (5.14)$$

where $p = b - a$ and $q = b + a$. Replacing $\phi(t)$ and $\phi'(t)$ in equations 7 by their Chebyshev series, we obtain

$$\sum_{k=0}^{\infty} '(-1)^k A_k^{(0)} = \phi(-1) \quad (5.15)$$

$$2 \sum_{k=0}^{\infty} 'A_k^{(1)}(pt+q)T_k(t) + p \sum_{k=0}^{\infty} 'A_k^{(0)}(pt+q-2)T_k(t) = p(pt+q) \quad (5.16)$$

It can be demonstrated that if B_k are the Chebyshev coefficients of a function $\Psi(t)$, then C_k , the Chebyshev coefficients of $t^r\Psi(t)$ for positive integers r , are given by

$$C_k = 2^{-r} \sum_{i=0}^r \binom{r}{i} B_{|k-r+2i|} \quad (5.17)$$

Consequently, the left member of equation 15 can be rearranged into a single series involving $T_k(t)$. The comparison of the coefficients of $T_k(t)$ that yields the infinite system of equations

$$\left. \begin{aligned} & \sum_{k=0}^{\infty} '(-1)^k A_k^{(0)} = \phi(-1) \\ & 2pA_{|k-1|}^{(1)} + 4qA_k^{(1)} + 2pA_{k+1}^{(1)} + p^2A_{|k-1|}^{(0)} + 2p(q-2)A_k^{(0)} + p^2A_{k+1}^{(0)} \\ & = \begin{cases} 4pq & , \quad k=0 \\ 2p^2 & , \quad k=1 \\ 0 & , \quad k=2,3,\dots \end{cases} \end{aligned} \right\} \quad (5.18)$$

¹The value of $Ei(a)$ may be evaluated by means of the Taylor series. In this report $Ei(a)$ is computed by first finding the Chebyshev series approximation to $[Ei(x) - \log|x| - \gamma]/x$ to get $Ei(a)$. The quantities e^a and $\log|a|$ for integral values of a may be found in existing tables

The relation

$$2kA_k^{(0)} = A_{k-1}^{(1)} - A_{k+1}^{(1)} \quad (5.19)$$

can be used to reduce equation 18 to a system of equations involving only $A_k^{(0)}$. Thus, replacing k of equations 18 by $k+2$ and subtracting the resulting equation from equations 18, we have, by means of equation 19, the system of equations

$$\left. \begin{aligned} \sum_{k=0}^{\infty} '(-1)^k A_k^{(0)} &= \phi(-1) \\ 2p(q-2)A_0 + (8q+p^2)A_1 + 2p(6-q)A_2 - p^2A_3 &= 4pq \\ p^2A_{k-1} + 2p(2k+q-2)A_k + 8q(k+1)A_{k+1} + 2p(2k-q+6)A_{k+2} - p^2A_{k+3} \\ &= \begin{cases} 2p^2 & , \quad k=1 \\ 0 & , \quad k=2,3,\dots \end{cases} \end{aligned} \right\} \quad (5.20)$$

The superscript of $A_k^{(0)}$ is dropped for simplicity. In order to solve the infinite system 20, Clenshaw essentially considered the required solution as the limiting solution of the sequence of truncated systems consisting of the first $M+1$ equations of the same system, that is, the solution of the system

$$\sum_{k=0}^M '(-1)^k A_k = \phi(-1) \quad (5.21)$$

$$2p(q-2)A_0 + (8q+p^2)A_1 + 2p(q-6)A_2 - p^2A_3 = 4pq \quad (5.22)$$

$$\left. \begin{aligned} p^2A_{k-1} + 2p(2k+q-2)A_k + 8q(k+1)A_{k+1} + 2p(2k-q+6)A_{k+2} - p^2A_{k+3} \\ &= \begin{cases} 2p^2 & , \quad k=1 \\ 0 & , \quad k=2,3,\dots,M-3 \end{cases} \\ p^2A_{M-3} + 2p(2M+q-6)A_{M-2} + 8q(M-1)A_{M-1} + 2p(2M+4-q)A_M &= 0 \\ p^2A_{M-2} + 2p(2M+q-4)A_{M-1} + 8qMA_M &= 0 \end{aligned} \right\} \quad (5.23)$$

where A_k is assumed to vanish for $K \geq M+1$. To solve system (21,22,23) consider first the subsystem 23 consisting of $M-2$ equations in M unknowns. Here use is made of the fact that the subsystem 23 is satisfied by

$$A_k = c_1\alpha_k + c_2\beta_k + \gamma_k \quad (k=0,1,2,\dots) \quad (5.24)$$

for arbitrary constants c_1 and c_2 , where γ_k is a particular solution of 23 and where α_k and β_k are two independent solutions of the homogeneous equations (23 with $2p^2$ deleted) of the same subsystem. Hence, if α_k , β_k , and γ_k are available, the solution of system (21,22,23) reduces to the determinant of c_1 and c_2 from equations 21 and 22.

To solve equations (21,22,23), we note that

$$\gamma_0 = 2, \quad \gamma_k = 0, \quad \text{for } k = 1(1)M \quad (5.25)$$

is obviously a particular solution of equation 23. The two independent solutions γ_k and β_k of the homogeneous equations of the same subsystem can be generated in turn by backward recurrence if we set

$$\text{and} \quad \left. \begin{array}{l} \alpha_{M-1} = 0, \quad \alpha_M = 1 \\ \beta_{M-1} = 1, \quad \beta_M = 0 \end{array} \right\} \quad (5.26)$$

or choose any α_{M-1} , α_M , and β_{M-1} , β_M for which $\alpha_{M-1}\beta_M - \alpha_M\beta_{M-1} \neq 0$. The arbitrary constants c_1 and c_2 are determined, and consequently the solution of equations (21,22,23) if equation 24 is substituted into equation 21 and 22 and the resulting equations

$$c_1 R(\alpha) + c_2 R(\beta) = \phi(-1) - 1 \quad (5.27)$$

$$c_1 S(\alpha) + c_2 S(\beta) = 8p \quad (5.28)$$

are solved as two equations in two unknowns. The terms $R(\alpha)$ and $S(\alpha)$ are equal, respectively, to the left members of equations 21 and 22 corresponding to solution α_k . (The identical designation holds for $R(\beta)$ and $S(\beta)$.)

The quantities α_k and β_k are known as trial solutions in reference. Clenshaw has pointed out that if α_k and β_k are not sufficiently independent, loss of significance will occur in the formation of the linear combination 24, with consequent loss of accuracy. Clenshaw suggested the Gauss-Seidel iteration procedure to improve the accuracy of the solution. However, this requires the application of an additional computing procedure and may prove to be extremely slow. A simpler procedure which does not alter the basic computing scheme given above is proposed here. The loss of accuracy can effectively be regained if we first generate a third trial solution δ_k ($k=0,1,\dots,M$), where δ_{M-1} and δ_M are equal to $c_1\alpha_{M-1} + c_2\beta_{M-1}$ and $c_1\alpha_M + c_2\beta_M$, respectively, and where δ_k ($k=M-2, M-3, \dots, 0$) is determined using backward recurrence as before by means of equation 23. Then either α_k or β_k is replaced by δ_k and a new set of c_1 and c_2 is determined by equations 27 and 28. Such a procedure can be repeated until the required accuracy is reached. However, only one application of it was necessary in the computation of the coefficients of this report.

As an example, consider the case for $4 \leq x \leq 12$ with $M = 15$. The right member of equation 27 and of equation 28 assume, respectively, the values of 0.43820800 and 64. The trial solutions α_k and β_k generated with $\alpha_{14} = 8$, $\alpha_{15} = 9$ and $\beta_{14} = 7$, $\beta_{15} = 8$ are certainly independent, since $\alpha_{14}\beta_{15} - \alpha_{15}\beta_{14} = 1 \neq 0$. A check of table 2 shows that equations 27 and 28 have, respectively, the residuals of -0.137×10^{-4} and -0.976×10^{-3} . The same table also shows that $c_1\alpha_k$ is opposite in sign but nearly equal in magnitude to $c_2\beta_k$. Cancellations in the formation of the linear combination 24 causes a loss of significance of 2 to 6 figures in the computed A_k . In the second iteration, where a new set of β_k is generated replacing β_{14} and β_{15} , respectively, by $c_1\alpha_{14} + c_2\beta_{14}$ and $c_1\alpha_{15} + c_2\beta_{15}$ of the first iteration, the new $c_1\alpha_k$ and $c_2\beta_k$ differed from 2 to 5 orders of magnitude. Consequently, no cancellation of significant

figures in the computation of A_k occurred. Notice that equations 27 and 28 are now satisfied exactly. Further note that the new c_1 and c_2 are near zero and unity, respectively, for the reason that if equations 21, 22, and 23 are satisfied by equation 24 exactly in the first iteration, the new c_1 and c_2 should have the precise values zero and 1, respectively. The results of the third iteration show that the A_k of the second iteration are already accurate to eight decimal places, since the A_k in the two iterations differ in less than 0.5×10^{-8} . Notice that for the third iteration, equations 27 and 28 are also satisfied exactly and that $c_1 = 1$ and $c_2 = 0$ (relative to 8 places of accuracy).

$$c_1 = 0.12118739E - 17$$

$$\begin{aligned}
c_2 &= 0.10000000E\ 01 \\
c_1 R(\alpha) + c_2 R(\beta) - 0.43820800E\ 00 &= 0.0 \\
c_1 S(\alpha) + c_2 S(\beta) - 0.64000000E\ 00 &= 0.0
\end{aligned}$$

It is worth noting that the coefficient matrix of system (21,22,23) yields an upper triangular matrix of order $M - 1$ after the deletion of the first two rows and the last two columns. Consequently, the procedure of this section is applicable to any linear system having this property. As a matter of fact, the same procedure can be generalized to solve linear systems having coefficient matrices of order N , the deletion of whose first r ($r < N$) rows and last r columns yields upper triangular matrices of order $N - r$.

The Function $(1/x)[Ei(x) - \log|x| - \gamma]$

Let

$$f(x) = (1/x)[Ei(x) - \log|x| - \gamma], \quad g(x) = e^x, \quad |x| \leq b \quad (5.29)$$

These functions, with the change of variable $x = bt$, simultaneously satisfy the differential equations

$$bt^2 \phi'(t) + bt\phi(t) - \psi(t) = -1 \quad (5.30)$$

$$\psi'(t) - b\psi(t) = 0, \quad -1 \leq t \leq 1 \quad (5.31)$$

Conversely,² any solution of equations 30 and 31 is equal to the functions given by equations 29 for the change of variable $x = bt$. Therefore, boundary conditions need not be imposed for the solution of the differential equations.

A procedure similar to that of the previous section gives the coupled infinite recurrence relations

$$bA_1 + bA_3 - B_0 + B_2 = -2 \quad (5.32)$$

$$\left. \begin{aligned} kbA_{k-1} + 2(k+1)bA_{k+1} + (k+2)bA_{k+3} - 2B_k + 2B_{k+2} &= 0 \\ bB_{k-1} - 2kB_k - bB_{k+1} &= 0, \quad k = 1, 2, \dots \end{aligned} \right\} \quad (5.33)$$

where A_k and B_k are the Chebyshev coefficients of $\phi(t)$ and $\psi(t)$, respectively.

Consider first the subsystem 33. If $A_k = \alpha_k$ and $B_k = \beta_k$ are a simultaneous solution of the system, which is homogeneous, then

$$\text{and} \quad \left. \begin{aligned} A_k &= c\alpha_k \\ B_k &= c\beta_k \end{aligned} \right\} \quad (5.34)$$

²The general solution of the differential equations has the form

$$\begin{aligned}
\phi(t) &= (c_1/t) + [Ei(bt) - \log|bt| - \gamma]/bt \\
\psi(t) &= c_2 e^{bt}
\end{aligned}$$

where the first and second terms of $\phi(t)$ are, respectively, the complementary solution and a particular integral of equation 30. The requirement that $\phi(t)$ is bounded makes the constant $c_1 = 0$. The fact that $\psi(0) = 1$ is implicit in equation 30.

are also a solution for an arbitrary constant c . Thus based on considerations analogous to the solution of equations 21, 22, and 23, one can initiate an approximate solution of equations 32 and 33 by setting

$$\left. \begin{aligned} \alpha_M = 0, \quad \alpha_k = 0 \quad \text{for } k \geq M+1 \\ \beta_M = 1, \quad \beta_k = 0 \quad \text{for } k \geq M+1 \end{aligned} \right\} \quad (5.35)$$

and then determining α_k and β_k ($k = M-1, M-2, \dots, 0$) by backward recurrence by means of equation 33. The arbitrary constant c is determined by substituting 34 into 32.

The Function $xe^{-x}Ei(x)$ on the Infinite Interval

Let

$$f(x) = xe^{-x}Ei(x), \quad -\infty < x \leq b < 0, \quad \text{or } 0 < b \leq x < \infty \quad (5.36)$$

By making the change of variables,

$$x = 2b/(t+1) \quad (5.37)$$

we can easily demonstrate that

$$f(x) = f[2b/(t+1)] = \phi(t) \quad (5.38)$$

satisfies the differential equation

$$(t+1)^2 \phi'(t) + (t+1-2b)\phi(t) = -2b \quad (5.39)$$

with

$$\phi(1) = be^{-b}Ei(b) \quad (5.40)$$

An infinite system of equations involving the Chebyshev coefficients A_k of $\phi(t)$ is deducible from equations 39 and 40 by the same procedure as applied to equations 13 and 14 to obtain the infinite system 20; it is given as follows.

$$\sum_{k=0}^{\infty} 'A_k = \phi(1) = be^{-b}Ei(b) \quad (5.41)$$

$$(1-2b)A_0 + 3A_1 + (3+2b)A_2 + A_3 = -4b \quad (5.42)$$

$$\begin{aligned} kA_{k-1} + 2[(2k+1)-2b]A_k + 6(k+1)A_{k+1} + 2(2k+3+2b)A_{k+2} \\ + (k+2)A_{k+3} = 0, \quad k = 1, 2, \dots \end{aligned} \quad (5.43)$$

As in the case of equations 21, 22 and 23, the solution of 41, 42 and 43 can be assumed to be

$$A_k = c_1\alpha_k + c_2\beta_k \quad (5.44)$$

with A_k vanishing for a $k \geq M$. Thus, we can set, say

$$\left. \begin{aligned} \alpha_{M-1} = 0 \quad , \quad \alpha_M = 1 \\ \beta_{M-1} = 1 \quad , \quad \beta_M = 0 \end{aligned} \right\} \quad (5.45)$$

and determine the trial solutions α_k and β_k ($k=M-1, M-2, \dots, 0$) by means of equation 43 by backward recurrence. The required solution of equations 41, 42, and 43 is then determined by substituting equation 44 in equations 41 and 42 and solving the resulting equations for c_1 and c_2 .

Loss of accuracy in the computation of A_k can also occur here, as in the solution of equations 21, 22 and 23, if the trial solutions are not sufficiently independent. The process used to improve the accuracy of A_k of the system 21, 22 and 23 can also be applied here.

For efficiency in computation, it is worth noting that for $b < 0$ ($-\infty < x \leq b < 0$) the boundary condition 40 is not required for the solution of equation 39 and 40. This follows from the fact that any solution³ of the differential equation 39 is equal to $xe^{-x}Ei(x)$ ($x = 2b/(t+1)$). Hence the A_k of $xe^{-x}Ei(x)$ for $-\infty < x \leq b < 0$ can be obtained without the use of equation 39 and can be assumed to have the form

$$A_k = c\alpha_k, \quad (k = 0, 1, \dots, M) \quad (5.46)$$

The $M+1$ values of α_k can be generated by setting $\alpha_M = 1$ and computing α_k ($k=0, 1, \dots, M-1$) by means of equation 43 by backward recurrence. The substitution of equation 46 into 42 then enables one to determine c from the resulting equation.

Remarks on Convergence and Accuracy

The Chebyshev coefficients of table 3 were computed on the IBM 7094 with 50-digit normalized floating-point arithmetic. In order to assure that the sequence of approximate solutions (see Discussion) converged to the limiting solution of the differential equation in question, a trial M was incremented by 4 until the approximate Chebyshev coefficients showed no change greater than or equal to 0.5×10^{-35} . Hence the maximum error is bounded by

$$0.5(M+1) \times 10^{-35} + \sum_{M+1}^{\infty} |A_k| \quad (5.47)$$

where the first term is the maximum error of the $M+1$ approximate Chebyshev coefficients, and the sum is the maximum error of the truncated Chebyshev series of $M+1$ terms. If the Chebyshev series is rapidly convergent, the maximum error of the approximate Chebyshev series should be of the order of 10^{-30} . The coefficients of table 3 have been rounded to 30 digits, and higher terms for $k > N$ giving the maximum residual

$$\sum_{k=N+1}^M |A_k| < 0.5 \times 10^{-30} \quad (5.48)$$

have been dropped. This should allow for evaluation of the relevant function that is accurate to 30 decimal places. Since the range of values of each function is bounded between $2/5$ and

³The general solution of the differential equation 39. Since equation 39 has no bounded complementary solution for $-\infty < x \leq b < 0$, every solution of it is equal to the particular integral $xe^{-x}Ei(x)$. On the other hand, a solution of equation 39 for $0 < x \leq b < \infty$ would, in general, involve the complementary function. Hence, boundary condition 40 is required to guarantee that the solution of equation 39 is equal to $xe^{-x}Ei(x)$.

5, the evaluated function should be good to 30 significant digits. Taylor series evaluation also checks with that of the function values of table 4 (computed with 30-digit floating-point arithmetic using the coefficients of table 3) for at least 28-1/2 significant digits. Evaluation of $Ei(x)$ using the coefficients of table 3 also checked with Murnaghan and Wrench for 28-1/2 significant figures.

Table 3: Chebyshev Coefficients (a)

$$xe^{-x}Ei(x) = \sum_{k=0}^{40} 'A_k T_k(t), \quad t = (-20/x) - 1, \quad (-\infty < x \leq -10)$$

The Fresnel Integral[Pear56, Losc60]

The Fresnel function is

$$C(x) - iS(x) = \int_0^x i^{-t^2} dt = \int_0^x \exp(-i\pi t^2/2) dt$$

We compare Axiom's results to Pearcey's tables which show the fresnel results to 6 decimal places. Computation of these values requires floats as the range quickly exceeds DoubleFloat. In each decade of the range we increase the number of terms by a factor of 10. So we compute with 10 terms in the range 0.0-10.0, 100 terms in 10.0-20.0, etc.

fresnelC

The fresnelC is the real portion of the Fresnel integral, C(u), is defined as:

$$C(\sqrt{2x/\pi}) = \frac{1}{2} \int_0^x J_{-\frac{1}{2}}(t) dt = \frac{1}{\sqrt{(2\pi)}} \int_0^x \frac{\cos(t)}{\sqrt{t}} dt$$

where $J_{-\frac{1}{2}}(t)$ is the Bessel function of the first kind of order $-\frac{1}{2}$.

This is related to the better known definition of C(u), namely:

$$C(u) = \int_0^u \cos \frac{\pi t^2}{2} dt$$

where $x = \pi u^2/2$, or $u = (2x/\pi)^{1/2}$

fresnelC is an analytic function of z with z=0 as a two-sheeted branch point. Along the positive real axis the real definition gives:

$$C(0) = 0$$

$$\lim_{x \rightarrow +\infty} C(x) = \frac{1}{2}$$

The asymptotic behavior of the function in the corner $|\arg z| \leq \pi - \epsilon$, ($\epsilon > 0$), for $|z| \gg 1$ is given by

$$C(z) \approx \frac{1}{2} + \frac{\sin z}{\sqrt{2\pi z}} \left(1 - \frac{1 \cdot 3}{(2z)^2} + \frac{1 \cdot 3 \cdot 5 \cdot 7}{(2z)^4} - \dots \right) - \frac{\cos z}{\sqrt{2\pi z}} \left(\frac{1}{(2z)} - \frac{1 \cdot 3 \cdot 5}{(2z)^3} + \dots \right)$$

(Note: Pearcey has a sign error for the second term ([Pear56],p7)

The first approximation is

$$C(z) \approx \frac{1}{2} + \frac{\sin z}{\sqrt{2\pi z}}$$

Axiom uses the power series at the zero point:

$$C(z) = \sqrt{\frac{2z}{\pi}} \sum_{k=0}^n (-1)^k \frac{z^{2k}}{(4k+1)(2k)!}$$

— package DFSFUN DoubleFloatSpecialFunctions —

```
fresnelC(z:F):F ==
  z < 0 => error "fresnelC not defined for negative argument"

  sqrt((2.0/pi()$F)*z)*_
  reduce(_+, [(-1)**k*z**(2*k)/(factorial(2*k)*(4*k+1))_
    for k in 0..n])$LF
```

—————

fresnelS

The fresnelS is the complex portion of the Fresnel integral, $S(u)$, is defined as:

$$S(\sqrt{2x/\pi}) = \frac{1}{2} \int_0^x J_{\frac{1}{2}}(t) dt = \frac{1}{\sqrt{(2\pi)}} \int_0^x \frac{\sin(t)}{\sqrt{t}} dt$$

where $J_{\frac{1}{2}}(t)$ is the Bessel function of the first kind of order $\frac{1}{2}$.

This is related to the better known definition of $S(u)$, namely:

$$S(u) = \int_0^u \sin \frac{\pi t^2}{2} dt$$

where $x = \pi u^2/2$, or $u = (2x/\pi)^{1/2}$

fresnelS is an analytic function of z with $z=0$ as a two-sheeted branch point. Along the positive real axis the real definition gives:

$$S(0) = 0$$

$$\lim_{x \rightarrow +\infty} S(x) = \frac{1}{2}$$

The asymptotic behavior of the function in the corner $|\arg z| \leq \pi - \epsilon$, ($\epsilon > 0$), for $|z| \gg 1$ is given by

$$S(z) \approx \frac{1}{2} - \frac{\cos z}{\sqrt{2\pi z}} \left(1 - \frac{1 \cdot 3}{(2z)^2} + \frac{1 \cdot 3 \cdot 5 \cdot 7}{(2z)^4} - \dots \right) - \frac{\sin z}{\sqrt{2\pi z}} \left(\frac{1}{(2z)} - \frac{1 \cdot 3 \cdot 5}{(2z)^3} + \dots \right)$$

The first approximation is

$$S(z) \approx \frac{1}{2} - \frac{\cos z}{\sqrt{2\pi z}}$$

Axiom uses the power series at the zero point:

$$S(z) = \sqrt{\frac{2z}{\pi}} \sum_{k=0}^n (-1)^k \frac{z^{2k+1}}{(4k+3)(2k+1)!}$$

— package DFSFUN DoubleFloatSpecialFunctions —

PC ==> Record(rr:SF, th:SF)
INT ==> Integer
SF ==> DoubleFloat
NNI ==> NonNegativeInteger
VIEW3D ==> ThreeDimensionalViewport
ARRAY2 ==> TwoDimensionalArray

SIG ==> with

drawComplex : (C -> C,S,S,Boolean) -> VIEW3D
++ drawComplex(f,rRange,iRange,arrows?)
++ draws a complex function as a height field.
++ It uses the complex norm as the height and the complex
++ argument as the color.
++ It will optionally draw arrows on the surface indicating the direction
++ of the complex value.
++ Sample call:
++ \spad{f z == exp(1/z)}
++ \spad{drawComplex(f, 0.3..3, 0..2*%pi, false)}
++ Parameter descriptions:
++ f: the function to draw
++ rRange : the range of the real values
++ iRange : the range of imaginary values
++ arrows? : a flag indicating whether to draw the phase arrows for f
++ Call the functions \axiomFunFrom{setRealSteps}{DrawComplex} and
++ \axiomFunFrom{setImagSteps}{DrawComplex} to change the
++ number of steps used in each direction.

drawComplexVectorField : (C -> C,S,S) -> VIEW3D
++ drawComplexVectorField(f,rRange,iRange)
++ draws a complex vector field using arrows on the \spad{x--y} plane.
++ These vector fields should be viewed from the top by pressing the
++ "XY" translate button on the 3-d viewport control panel.
++ Sample call:
++ \spad{f z == sin z}
++ \spad{drawComplexVectorField(f, -2..2, -2..2)}
++ Parameter descriptions:
++ f : the function to draw
++ rRange : the range of the real values
++ iRange : the range of the imaginary values
++ Call the functions \axiomFunFrom{setRealSteps}{DrawComplex} and
++ \axiomFunFrom{setImagSteps}{DrawComplex} to change the
++ number of steps used in each direction.

setRealSteps: INT -> INT
++ setRealSteps(i)
++ sets to i the number of steps to use in the real direction

```

```

    ++ when drawing complex functions. Returns i.

setImagSteps : INT -> INT
  ++ setImagSteps(i)
  ++ sets to i the number of steps to use in the imaginary direction
  ++ when drawing complex functions. Returns i.

setClipValue : SF-> SF
  ++ setClipValue(x)
  ++ sets to x the maximum value to plot when drawing complex functions. Returns x.

DrawNumericHack examples
=====
```

Hack for the draw interface. DrawNumericHack provides a "coercion" from something of the form $x = a..b$ where a and b are formal expressions to a binding of the form $x = c..d$ where c and d are the numerical values of a and b . This "coercion" fails if a and b contains symbolic variables, but is meant for expressions involving $\%pi$.

Note that this package is meant for internal use only.

++ Description:
++ This package has no description
-- The functions here are not in DrawOptions since they are not
-- visible to the interpreter.
```

```
DrawOptionFunctions0() : SIG == CODE where
```

```

RANGE ==> List Segment Float
UNIT  ==> List Float
PAL   ==> Palette
POINT ==> Point(DoubleFloat)
SEG   ==> Segment Float
SF    ==> DoubleFloat
SPACE3 ==> ThreeSpace(DoubleFloat)
VIEWPT ==> Record( theta:SF, phi:SF, scale:SF, scaleX:SF, scaleY:SF, scaleZ:SF, deltaX:SF, deltaY:SF )

SIG ==> with

adaptive : (List DrawOption, Boolean) -> Boolean
++ adaptive(l,b) takes the list of draw options, l, and checks
++ the list to see if it contains the option \spad{adaptive}.
++ If the option does not exist the value, b is returned.

clipBoolean : (List DrawOption, Boolean) -> Boolean
++ clipBoolean(l,b) takes the list of draw options, l, and checks
++ the list to see if it contains the option \spad{clipBoolean}.
++ If the option does not exist the value, b is returned.

viewpoint : (List DrawOption, VIEWPT) -> VIEWPT
++ viewpoint(l,ls) takes the list of draw options, l, and checks
++ the list to see if it contains the option \spad{viewpoint}.
++ IF the option does not exist, the value ls is returned.

title : (List DrawOption, String) -> String
++ title(l,s) takes the list of draw options, l, and checks
++ the list to see if it contains the option \spad{title}.
++ If the option does not exist the value, s is returned.

style : (List DrawOption, String) -> String
++ style(l,s) takes the list of draw options, l, and checks
++ the list to see if it contains the option \spad{style}.
++ If the option does not exist the value, s is returned.

toScale : (List DrawOption, Boolean) -> Boolean
++ toScale(l,b) takes the list of draw options, l, and checks
++ the list to see if it contains the option \spad{toScale}.
++ If the option does not exist the value, b is returned.

pointColorPalette : (List DrawOption,PAL) -> PAL
++ pointColorPalette(l,p) takes the list of draw options, l, and checks
++ the list to see if it contains the option \spad{pointColorPalette}.
++ If the option does not exist the value, p is returned.

curveColorPalette : (List DrawOption,PAL) -> PAL
++ curveColorPalette(l,p) takes the list of draw options, l, and checks
++ the list to see if it contains the option \spad{curveColorPalette}.
++ If the option does not exist the value, p is returned.

```

```

ranges : (List DrawOption, RANGE) -> RANGE
++ ranges(l,r) takes the list of draw options, l, and checks
++ the list to see if it contains the option \spad{ranges}.
++ If the option does not exist the value, r is returned.

var1Steps : (List DrawOption, PositiveInteger) -> PositiveInteger
++ var1Steps(l,n) takes the list of draw options, l, and checks
++ the list to see if it contains the option \spad{var1Steps}.
++ If the option does not exist the value, n is returned.

var2Steps : (List DrawOption, PositiveInteger) -> PositiveInteger
++ var2Steps(l,n) takes the list of draw options, l, and checks
++ the list to see if it contains the option \spad{var2Steps}.
++ If the option does not exist the value, n is returned.

space : (List DrawOption) -> SPACE3
++ space(l) takes a list of draw options, l, and checks to see
++ if it contains the option \spad{space}. If the the option
++ doesn't exist, then an empty space is returned.

tubePoints : (List DrawOption, PositiveInteger) -> PositiveInteger
++ tubePoints(l,n) takes the list of draw options, l, and checks
++ the list to see if it contains the option \spad{tubePoints}.
++ If the option does not exist the value, n is returned.

tubeRadius : (List DrawOption, Float) -> Float
++ tubeRadius(l,n) takes the list of draw options, l, and checks
++ the list to see if it contains the option \spad{tubeRadius}.
++ If the option does not exist the value, n is returned.

coord : (List DrawOption, (POINT->POINT)) -> (POINT->POINT)
++ coord(l,p) takes the list of draw options, l, and checks
++ the list to see if it contains the option \spad{coord}.
++ If the option does not exist the value, p is returned.

units : (List DrawOption, UNIT) -> UNIT
++ units(l,u) takes the list of draw options, l, and checks
++ the list to see if it contains the option \spad{unit}.
++ If the option does not exist the value, u is returned.

rangeIsFinite : NIA -> RTYPE
++ rangeIsFinite(args) tests the endpoints of \spad{args.range} for
++ infinite end points.

functionIsContinuousAtEndPoints : NIA -> CTYPE
++ functionIsContinuousAtEndPoints(args) uses power series limits
++ to check for problems at the end points of the range of \spad{args}.

getlo : SOCDF -> DF
++ getlo(x) gets the \axiomType{DoubleFloat} equivalent of
++ the first endpoint of the range \axiom{x}

gethi : SOCDF -> DF
++ gethi(x) gets the \axiomType{DoubleFloat} equivalent of
++ the second endpoint of the range \axiom{x}

functionIsOscillatory : NIA -> F
++ functionIsOscillatory(a) tests whether the function \spad{a.fn}
++ has many zeros of its derivative.

problemPoints : (EDF, Symbol, SOCDF) -> List DF
++ problemPoints(f,var,range) returns a list of possible problem points
++ by looking at the zeros of the denominator of the function if it

```

```

    ++ can be retracted to \axiomType{Polynomial DoubleFloat}.

singularitiesOf : NIA -> SDF
  ++ singularitiesOf(args) returns a list of potential
  ++ singularities of the function within the given range

df2st : DF -> String
  ++ df2st(n) coerces a \axiomType{DoubleFloat} to \axiomType{String}

ldf2lst : LDF -> LST
  ++ ldf2lst(ln) coerces a List of \axiomType{DoubleFloat} to
  ++ \axiomType{List String}

sdf2lst : SDF -> LST
  ++ sdf2lst(ln) coerces a Stream of \axiomType{DoubleFloat} to
  ++ \axiomType{List String}

commaSeparate : LST -> ST
  ++ commaSeparate(l) produces a comma separated string from a
  ++ list of strings.

changeName : (Symbol,Symbol,Result) -> Result
  ++ changeName(s,t,r) changes the name of item \axiom{s} in \axiom{r}
  ++ to \axiom{t}.

SIG ==> with

combineFeatureCompatibility : (F,F) -> F
  ++ combineFeatureCompatibility(C1,C2) is for interacting attributes

combineFeatureCompatibility : (F,LF) -> F
  ++ combineFeatureCompatibility(C1,L) is for interacting attributes

sparsityIF : MEDF -> F
  ++ sparsityIF(m) calculates the sparsity of a jacobian matrix

jacobian : (VEDF,LS) -> MEDF
  ++ jacobian(v,w) is a local function to make a jacobian matrix

eval: (MEDF,LS,VEDF) -> MEDF
  ++ eval(mat,symbols,values) evaluates a multivariable matrix at given values
  ++ for each of a list of variables

stiffnessAndStabilityFactor : MEDF -> RSS
  ++ stiffnessAndStabilityFactor(me) calculates the stability and
  ++ stiffness factor of a system of first-order differential equations
  ++ (by evaluating the maximum difference in the real parts of the
  ++ negative eigenvalues of the jacobian of the system for which 0(10)
  ++ equates to mildly stiff whereas stiffness ratios of 0(10^6) are not
  ++ uncommon) and whether the system is likely to show any oscillations
  ++ (identified by the closeness to the imaginary axis of the complex
  ++ eigenvalues of the jacobian).
```

```

stiffnessAndStabilityOfODEIF : ODEA -> RSS
++ stiffnessAndStabilityOfODEIF(ode) calculates the intensity values
++ of stiffness of a system of first-order differential equations
++ (by evaluating the maximum difference in the real parts of the
++ negative eigenvalues of the jacobian of the system for which  $O(10)$ 
++ equates to mildly stiff whereas stiffness ratios of  $O(10^6)$  are not
++ uncommon) and whether the system is likely to show any oscillations
++ (identified by the closeness to the imaginary axis of the complex
++ eigenvalues of the jacobian).
++
++ It returns two values in the range [0,1].

systemSizeIF : ODEA -> F
++ systemSizeIF(ode) returns the intensity value of the size of
++ the system of ODEs. 20 equations corresponds to the neutral
++ value. It returns a value in the range [0,1].

expenseOfEvaluationIF : ODEA -> F
++ expenseOfEvaluationIF(o) returns the intensity value of the
++ cost of evaluating the input ODE. This is in terms of the number
++ of 'operational units'. It returns a value in the range
++ [0,1].\indent{20}
++ 400 'operation units' -> 0.75
++ 200 'operation units' -> 0.5
++ 83 'operation units' -> 0.25 \indent{15}
++ exponentiation = 4 units , function calls = 10 units.

accuracyIF : ODEA -> F
++ accuracyIF(o) returns the intensity value of the accuracy
++ requirements of the input ODE. A request of accuracy of  $10^{-6}$ 
++ corresponds to the neutral intensity. It returns a value
++ in the range [0,1].

intermediateResultsIF : ODEA -> F
++ intermediateResultsIF(o) returns a value corresponding to the
++ required number of intermediate results required and, therefore,
++ an indication of how much this would affect the step-length of the
++ calculation. It returns a value in the range [0,1].

EigenPackage examples

=====

This is a package for the exact computation of eigenvalues and eigenvectors. This package can be made to work for matrices with coefficients which are rational functions over a ring where we can factor polynomials. Rational eigenvalues are always explicitly computed while the non-rational ones are expressed in terms of their minimal polynomial.

GenEigen   ==> Record(eigval:Eigenvalue,geneigvec:List M)

```

```

SIG ==> with

```

```

characteristicPolynomial : (M,Symbol) -> P
  ++ characteristicPolynomial(m,var) returns the
  ++ characteristicPolynomial of the matrix m using
  ++ the symbol var as the main variable.

characteristicPolynomial : M -> P
  ++ characteristicPolynomial(m) returns the
  ++ characteristicPolynomial of the matrix m using
  ++ a new generated symbol symbol as the main variable.

eigenvalues : M -> List Eigenvalue
  ++ eigenvalues(m) returns the
  ++ eigenvalues of the matrix m which are expressible
  ++ as rational functions over the rational numbers.

eigenvector : (Eigenvalue,M) -> List M
  ++ eigenvector(eigval,m) returns the
  ++ eigenvectors belonging to the eigenvalue eigval
  ++ for the matrix m.

```

```

generalizedEigenvector : (Eigenvalue,M,NNI,NNI) -> List M
++ generalizedEigenvector(alpha,m,k,g)
++ returns the generalized eigenvectors
++ of the matrix relative to the eigenvalue alpha.
++ The integers k and g are respectively the algebraic and the
++ geometric multiplicity of the eigenvalue alpha.
++ alpha can be either rational or not.
++ In the second case alpha is the minimal polynomial of the
++ eigenvalue.

generalizedEigenvector : (EigenForm,M) -> List M
++ generalizedEigenvector(eigen,m)
++ returns the generalized eigenvectors
++ of the matrix relative to the eigenvalue eigen, as
++ returned by the function eigenvectors.

generalizedEigenvectors : M -> List GenEigen
++ generalizedEigenvectors(m)
++ returns the generalized eigenvectors
++ of the matrix m.

eigenvectors : M -> List(EigenForm)
++ eigenvectors(m) returns the eigenvalues and eigenvectors
++ for the matrix m.
++ The rational eigenvalues and the correspondent eigenvectors
++ are explicitly computed, while the non rational ones
++ are given via their minimal polynomial and the corresponding
++ eigenvectors are expressed in terms of a "generic" root of
++ such a polynomial.

--R
--R                                          Type: Expression(Integer)
--E 15

```

Mathematica, Maple, and Maxima give:

$$\frac{3}{(3*x + 6*y)^2 \sqrt{1 - \frac{1}{(3*x+6*y)^2}}}$$

which proceeds directly from the formula for the derivative of asec:

$$\frac{d}{dx} \operatorname{arcsec}(x) = \frac{1}{x\sqrt{x^2 - 1}}$$

— ElementaryFunction.input —

```

--S 16 of 33
D(asec(3*x+6*y),x)
--R
--R
--R
--R          1

```

```

--R (14) -----
--R          +-----+
--R          | 2      2
--R      (2y + x)\|36y + 36x y + 9x - 1
--R
--R                                          Type: Expression(Integer)
--E 16

```

—————
 If we use the same formula for this example:

$$\frac{1}{(3 * x + 6 * y) \sqrt{(3 * x + 6 * y)^2 - 1}} d(3 * x + 6 * y) / dx$$

— ElementaryFunction.input —

```

--S 17 of 33
3/((3*x+6*y)*sqrt((3*x+6*y)^2-1))
--R
--R
--R          1
--R      (15) -----
--R          +-----+
--R          | 2      2
--R      (2y + x)\|36y + 36x y + 9x - 1
--R
--R                                          Type: Expression(Integer)
--E 17

```

—————
 Mathematica, Maple, and Maxima give

$$-\frac{3}{(3 * x + 6 * y)^2 \sqrt{1 - \frac{1}{(3 * x + 6 * y)^2}}}$$

which is just the negative of the above result and we can see that the same analysis applies to explain the results.

— ElementaryFunction.input —

```

--S 18 of 33
D(acsc(3*x+6*y),x)
--R
--R
--R          1
--R      (16) - -----
--R          +-----+
--R          | 2      2

```

```

--R      (2y + x)\|36y  + 36x y + 9x  - 1
--R
--R                                          Type: Expression(Integer)

--R
--R                                          Type: Expression(Integer)
--E 20

```

Mathematica and Maxima return

$$3\operatorname{sech}(3x + 6y)^2$$

Maple returns Axiom's answer. Both are equivalent.

— **ElementaryFunction.input** —

```

--S 21 of 33
D(tanh(3*x+6*y),x)
--R
--R
--R
--R      (19)  - 3tanh(6y + 3x)2 + 3
--R
--R                                          Type: Expression(Integer)
--E 21

--S 22 of 33
simplify ((-3*tanh(6*y+3*x)^2+3)-(3*sech(3*x+6*y)^2))
--R
--R
--R      (20)  0
--R
--R                                          Type: Expression(Integer)
--E 22

```

$$-3csch(3 * x + 6 * y)^2$$

— ElementaryFunction.input —

[illegible]

--E 27

Mathematica and Maple show

$$\frac{3}{\sqrt{-1+3*x+6*y}\sqrt{1+3*x+6*y}}$$

Maxima gives Axiom's answer. Both are equivalent, just factored forms.

— **ElementaryFunction.input** —

--S 28 of 33

D(acossh(3*x+6*y),x)

--R

--R

--R (26)
$$-\frac{3}{\sqrt{36y^2 + 36xy + 9x^2 - 1}}$$

--R

Type: Expression(Integer)

--E 28

--S 29 of 33

D(atanh(3*x+6*y),x)

--R

--R

--R (27)
$$-\frac{3}{36y^2 + 36xy + 9x^2 - 1}$$

--R

Type: Expression(Integer)

--E 29

--S 30 of 33

D(acoth(3*x+6*y),x)

--R

--R

--R (28)
$$-\frac{3}{36y^2 + 36xy + 9x^2 - 1}$$

--R

Type: Expression(Integer)

--E 30

Mathematica gives

$$-\frac{3}{(3x+6y)\sqrt{\frac{1-3x-6y}{13x+6y}}(1+3x+6y)}$$

Maxima gives

$$-\frac{3}{(6y+3x)^2\sqrt{\frac{1}{(6y+3x)^2}-1}}$$

Maple gives

$$-\frac{3}{(3x+6y)^2\sqrt{\frac{1}{3x+6y}-1}\sqrt{\frac{1}{3x+6y}+1}}$$

Axiom cannot simplify these differences to zero but Maxima does which shows they are all equivalent answers.

— **ElementaryFunction.input** —

```
--S 31 of 33
D(asech(3*x+6*y),x)
--R
--R
--R
--R      1
--R      (29)  - ----
--R            +-----+
--R            |      2      2
--R      (2y + x)\|- 36y  - 36x y - 9x  + 1
--R
--R                                                    Type: Expression(Integer)
--E 31
```

Mathematica, Maple, and Maxima all generate the answer

$$-\frac{3}{(3x+6y)^2\sqrt{1+\frac{1}{(3x+6y)^2}}}$$

Axiom cannot simplify these differences to zero but Maxima does which shows they are all equivalent answers.

U ==> Union(f1:OFE, f2:List OFE, fail:"failed", pole:"potentialPole")

SIG ==> with

```

```

integrate : (F, SegmentBinding OFE) -> U
++ integrate(f, x = a..b) returns the integral of
++ \spad{f(x)dx} from a to b.
++ Error: if f has a pole for x between a and b.

integrate : (F, SegmentBinding OFE, String) -> U
++ integrate(f, x = a..b, "noPole") returns the
++ integral of \spad{f(x)dx} from a to b.
++ If it is not possible to check whether f has a pole for x
++ between a and b (because of parameters), then this function
++ will assume that f has no such pole.
++ Error: if f has a pole for x between a and b or
++ if the last argument is not "noPole".

innerint : (F, SE, OFE, OFE, B) -> U
++ innerint(f, x, a, b, ignore?) should be local but conditional

```

REC ==> Record(particular: F, basis: List F)
U ==> Union(REC, "failed")
ALGOP ==> "%alg"

SIG ==> with

solve : (L, F, SY) -> U
  ++ solve(op, g, x) returns either a solution of the ordinary differential
  ++ equation \spad{op y = g} or "failed" if no non-trivial solution can be
  ++ found; When found, the solution is returned in the form
  ++ \spad{[h, [b1,...,bm]]} where \spad{h} is a particular solution and
  ++ and \spad{[b1,...,bm]} are linearly independent solutions of the
  ++ associated homogenous equation \spad{op y = 0}.
  ++ A full basis for the solutions of the homogenous equation
  ++ is not always returned, only the solutions which were found;
  ++ \spad{x} is the dependent variable.

solve : (L, F, SY, F, List F) -> Union(F, "failed")
  ++ solve(op, g, x, a, [y0,...,ym]) returns either the solution
  ++ of the initial value problem \spad{op y = g, y(a) = y0, y'(a) = y1,...}
  ++ or "failed" if the solution cannot be found;
  ++ \spad{x} is the dependent variable.

SIG ==> with

solve : (M, V, SY) -> Union(VEC, "failed")
++ solve(m, v, x) returns \spad{[v_p, [v_1,...,v_m]]} such that
++ the solutions of the system \spad{D y = m y + v} are
++ \spad{v_p + c_1 v_1 + ... + c_m v_m} where the \spad{c_i's} are
++ constants, and the \spad{v_i's} form a basis for the solutions of
++ \spad{D y = m y}.
++ \spad{x} is the dependent variable.

solve : (M, SY) -> Union(List V, "failed")
++ solve(m, x) returns a basis for the solutions of \spad{D y = m y}.
++ \spad{x} is the dependent variable.

solve : (List EQ, List OP, SY) -> Union(VEC, "failed")
++ solve([eq_1,...,eq_n], [y_1,...,y_n], x) returns either "failed"
++ or, if the equations form a first order linear system, a solution
++ of the form \spad{[y_p, [b_1,...,b_n]]} where \spad{h_p} is a
++ particular solution and \spad{[b_1,...,b_m]} are linearly independent
++ solutions of the associated homogenous system.
++ error if the equations do not form a first order linear system

solve : (List F, List OP, SY) -> Union(VEC, "failed")
++ solve([eq_1,...,eq_n], [y_1,...,y_n], x) returns either "failed"
++ or, if the equations form a first order linear system, a solution
++ of the form \spad{[y_p, [b_1,...,b_n]]} where \spad{h_p} is a

```

```

++ particular solution and \spad{[b_1,...b_m]} are linearly independent
++ solutions of the associated homogenous system.
++ error if the equations do not form a first order linear system

solve : (EQ, OP, SY) -> U
++ solve(eq, y, x) returns either a solution of the ordinary differential
++ equation \spad{eq} or "failed" if no non-trivial solution can be found;
++ If the equation is linear ordinary, a solution is of the form
++ \spad{[h, [b1,...,bm]]} where \spad{h} is a particular solution
++ and \spad{[b1,...bm]} are linearly independent solutions of the
++ associated homogenous equation \spad{f(x,y) = 0};
++ A full basis for the solutions of the homogenous equation
++ is not always returned, only the solutions which were found;
++ If the equation is of the form {dy/dx = f(x,y)}, a solution is of
++ the form \spad{h(x,y)} where \spad{h(x,y) = c} is a first integral
++ of the equation for any constant \spad{c};
++ error if the equation is not one of those 2 forms;

solve : (F, OP, SY) -> U
++ solve(eq, y, x) returns either a solution of the ordinary differential
++ equation \spad{eq} or "failed" if no non-trivial solution can be found;
++ If the equation is linear ordinary, a solution is of the form
++ \spad{[h, [b1,...,bm]]} where \spad{h} is a particular solution and
++ and \spad{[b1,...bm]} are linearly independent solutions of the
++ associated homogenous equation \spad{f(x,y) = 0};
++ A full basis for the solutions of the homogenous equation
++ is not always returned, only the solutions which were found;
++ If the equation is of the form {dy/dx = f(x,y)}, a solution is of
++ the form \spad{h(x,y)} where \spad{h(x,y) = c} is a first integral
++ of the equation for any constant \spad{c};

solve : (EQ, OP, EQ, List F) -> UU
++ solve(eq, y, x = a, [y0,...,ym]) returns either the solution
++ of the initial value problem \spad{eq, y(a) = y0, y'(a) = y1,...}
++ or "failed" if the solution cannot be found;
++ error if the equation is not one linear ordinary or of the form
++ \spad{dy/dx = f(x,y)};

solve : (F, OP, EQ, List F) -> UU
++ solve(eq, y, x = a, [y0,...,ym]) returns either the solution
++ of the initial value problem \spad{eq, y(a) = y0, y'(a) = y1,...}
++ or "failed" if the solution cannot be found;
++ error if the equation is not one linear ordinary or of the form
++ \spad{dy/dx = f(x,y)};

normalize : F -> F
  ++ normalize(f) rewrites \spad{f} using the least possible number of
  ++ real algebraically independent kernels.

normalize : (F, SY) -> F
  ++ normalize(f, x) rewrites \spad{f} using the least possible number of
  ++ real algebraically independent kernels involving \spad{x}.

rischNormalize : (F, SY) -> REC
  ++ rischNormalize(f, x) returns \spad{[g, [k1,...,kn], [h1,...,hn]]}
  ++ such that \spad{g = normalize(f, x)} and each \spad{ki} was
  ++ rewritten as \spad{hi} during the normalization.

realElementary : F -> F
  ++ realElementary(f) rewrites \spad{f} in terms of the 4 fundamental real
  ++ transcendental elementary functions: \spad{log, exp, tan, atan}.

realElementary : (F, SY) -> F
  ++ realElementary(f,x) rewrites the kernels of \spad{f} involving
  ++ \spad{x} in terms of the 4 fundamental real
  ++ transcendental elementary functions: \spad{log, exp, tan, atan}.

validExponential : (List K, F, SY) -> Union(F, "failed")
  ++ validExponential([k1,...,kn],f,x) returns \spad{g} if \spad{exp(f)=g}
  ++ and \spad{g} involves only \spad{k1...kn}, and "failed" otherwise.

rootNormalize : (F, K) -> F
  ++ rootNormalize(f, k) returns \spad{f} rewriting either \spad{k} which
  ++ must be an nth-root in terms of radicals already in \spad{f}, or some
  ++ radicals in \spad{f} in terms of \spad{k}.

tanQ : (Q, F) -> F
  ++ tanQ(q,a) is a local function with a conditional implementation.

```

Bug #100 is an infinite loop that eventually kills Axiom from the input

```
integrate((z^a+1)^b,z)
```

Line 2 of this function used to read:

```
symbolIfCan(k := kmax(l := union(l, varselect(kernels g, x))))
```

The loop occurs when the call to union causes

```

      a log(z)
    %e

```

to get added to the list every time. This gives the argument to kmax

```

      a log(z)
arg1= [z,%e      ]

```

and the result being

```
a log(z)
%e
```

We keep coming back to process this term, which ends up putting the same term back on the list and we loop. Waldek's solution is to remove the union call.

The original patch fixed the infinite regression mentioned above but caused Axiom to return a closed form of the integral:

$$\text{integrate}(\text{asech}(x)/x, x)$$

which should not have a closed form. This is referenced in the FriCAS SVN revision 279.

Essentially this new patch uses only logarithms of rational functions when integrating rational functions. It is unclear whether this is the correct fix.

— package INTEF ElementaryIntegration —

```
lfextendedint(f, x, g) ==
  empty?(l1 := varselect(kernels f, x)) => [x::F * f, 0]
  symbolIfCan(k := kmax(l1))
  case SE =>
    g1 :=
      empty?(l1 := varselect(kernels g, x)) => 0::F
      kmax(l1) = k => g
      0::F
    map((x1:RF):F +-> multivariate(x1, k),
      extendedint(univariate(f, k),
        univariate(g1, k)))
  is?(k, "exp"::SE) => expextint(f, x, k, g)
  prim?(k, x) => primextint(f, x, k, g)
  has?(operator k, ALGOP) => alglfextint(f, k, l, x, g)
  unkextint(f, x, g)
```

—————
This is part of the fix for bug 100. Line 2 of this function used to read:

```
symbolIfCan(k := kmax(l := union(l, vark(lu, x)))) case SE =>
```

See the above discussion for why this causes an infinite loop.

— package INTEF ElementaryIntegration —

rischDE : (Z, F, F, SE, (F, LF) -> U, (F, F) -> UEX) -> PSOL
++ rischDE(n, f, g, x, lim, ext) returns \spad{[y, h, b]} such that
++ \spad{dy/dx + n df/dx y = h} and \spad{b := h = g}.
++ The equation \spad{dy/dx + n df/dx y = g} has no solution
++ if \spad{h \~= g} (y is a partial solution in that case).
++ Notes: lim is a limited integration function, and
++ ext is an extended integration function.

=====

ErrorFunctions examples

=====

ErrorFunctions implements error functions callable from the system interpreter. Typically, these functions would be called in user functions. The simple forms of the functions take one argument which is either a string (an error message) or a list of strings which all together make up a message. The list can contain formatting codes (see below). The more sophisticated versions takes two arguments where the first argument is the name of the function from which the error was invoked and the second argument is either a string or a list of strings, as above. When you use the one argument version in an interpreter function, the system will automatically insert the name of the function as the new first argument. Thus in the user interpreter function

```
f x == if x < 0 then error "negative argument" else x
```

the call to error will actually be of the form

```
error("f","negative argument")
```

because the interpreter will have created a new first argument.

Formatting codes: error messages may contain the following formatting codes (they should either start or end a string or else have blanks around them):

%l	start a new line
%ceon	start centering message lines
%ceoff	stop centering message lines
%rjon	start displaying lines "ragged left"
%rjoff	stop displaying lines "ragged left"
%i	indent following lines 3 additional spaces
%u	unindent following lines 3 additional spaces
%xN	insert N blanks (eg, %x10 inserts 10 blanks)

Examples:

1. `error "Whoops, you made a %l %ceon big %ceoff %l mistake!"`
2. `error ["Whoops, you made a","%l %ceon ","big",
"%d %ceoff %l","mistake!"]`

=====

EuclideanGroebnerBasisPackage examples

=====

EuclideanGroebnerBasisPackage computes groebner bases for polynomial ideals over euclidean domains. The basic computation provides a distinguished set of generators for these ideals. This basis allows an easy test for membership: the operation euclideanNormalForm returns zero on ideal members. The string "info" and "redcrit" can be given as additional args to provide incremental information during the computation.

If "info" is given, a computational summary is given for each s-polynomial. If "redcrit" is given, the reduced critical pairs are printed.

The term ordering is determined by the polynomial type used.

Suggested types include

- * DistributedMultivariatePolynomial
- * HomogeneousDistributedMultivariatePolynomial
- * GeneralDistributedMultivariatePolynomial

Example to call euclideanGroebner:

```
a1:DMP([y,x],INT):= (9*x**2 + 5*x - 3)+ y*(3*x**2 + 2*x + 1)
a2:DMP([y,x],INT):= (6*x**3 - 2*x**2 - 3*x +3) + y*(2*x**3 - x - 1)
a3:DMP([y,x],INT):= (3*x**3 + 2*x**2) + y*(x**3 + x**2)
an:=[a1,a2,a3]
euclideanGroebner(an)
```

This will return the weak euclidean Groebner basis set.
All reductions are total reductions.

You can get more information by providing a second argument.
To get the reduced critical pairs do:

```
euclideanGroebner(an,"redcrit")
```

You can get other information by calling:

```
euclideanGroebner(an,"info")
```

which returns:

```
ci => Leading monomial for critpair calculation
tci => Number of terms of polynomial i
cj => Leading monomial for critpair calculation
tcj => Number of terms of polynomial j
c => Leading monomial of critpair polynomial
tc => Number of terms of critpair polynomial
rc => Leading monomial of redcritpair polynomial
trc => Number of terms of redcritpair polynomial
tH => Number of polynomials in reduction list H
tD => Number of critpairs still to do
```

The three argument form returns all of the information:

```
euclideanGroebner(an,"info","redcrit")
```

The term ordering is determined by the polynomial type used.

Suggested types include

- DistributedMultivariatePolynomial
- HomogeneousDistributedMultivariatePolynomial
- GeneralDistributedMultivariatePolynomial

UP   ==> UnivariatePolynomial
BO   ==> BasicOperator
RS   ==> Record(zeros: SDF,ones: SDF,singularities: SDF)

SIG ==> with

getlo : SOCDF -> DF
++ getlo(u) gets the \axiomType{DoubleFloat} equivalent of
++ the first endpoint of the range \axiom{u}

gethi : SOCDF -> DF
++ gethi(u) gets the \axiomType{DoubleFloat} equivalent of
++ the second endpoint of the range \axiom{u}

functionIsFracPolynomial? : NIA -> Boolean
++ functionIsFracPolynomial?(args) tests whether the function
++ can be retracted to \axiomType{Fraction(Polynomial(DoubleFloat))}

problemPoints : (EDF,Symbol,SOCDF) -> List DF
++ problemPoints(f,var,range) returns a list of possible problem points
++ by looking at the zeros of the denominator of the function \spad{f}
++ if it can be retracted to \axiomType{Polynomial(DoubleFloat)}.

zerosOf : (EDF,List Symbol,SOCDF) -> SDF
++ zerosOf(e,vars,range) returns a list of points
++ (\axiomType{Doublefloat}) at which a NAG fortran version of \spad{e}
++ will most likely produce an error.

```

```

singularitiesOf : (EDF,List Symbol,SOCDF) -> SDF
++ singularitiesOf(e,vars,range) returns a list of points
++ (\axiomType{Doublefloat}) at which a NAG fortran
++ version of \spad{e} will most likely produce
++ an error. This includes those points which evaluate to 0/0.

singularitiesOf : (Vector EDF,List Symbol,SOCDF) -> SDF
++ singularitiesOf(v,vars,range) returns a list of points
++ (\axiomType{Doublefloat}) at which a NAG fortran
++ version of \spad{v} will most likely produce
++ an error. This includes those points which evaluate to 0/0.

polynomialZeros : (PFI,Symbol,SOCDF) -> LDF
++ polynomialZeros(fn,var,range) calculates the real zeros of the
++ polynomial which are contained in the given interval. It returns
++ a list of points (\axiomType{Doublefloat}) for which the univariate
++ polynomial \spad{fn} is zero.

df2st : DF -> String
++ df2st(n) coerces a \axiomType{DoubleFloat} to \axiomType{String}

ldf2lst : LDF -> List String
++ ldf2lst(ln) coerces a List of \axiomType{DoubleFloat} to
++ \axiomType{List}(\axiomType{String})

sdf2lst : SDF -> List String
++ sdf2lst(ln) coerces a Stream of \axiomType{DoubleFloat} to
++ \axiomType{List}(\axiomType{String})

SIG ==> with

f2df : F -> DF
++ f2df(f) is a function to convert a \axiomType{Float} to a
++ \axiomType{DoubleFloat}

ef2edf : EF -> EDF
++ ef2edf(f) is a function to convert an \axiomType{Expression Float}
++ to an \axiomType{Expression DoubleFloat}

ocf2ocdf : OCF -> OCDF
++ ocf2ocdf(a) is a function to convert an \axiomType{OrderedCompletion
++ Float} to an \axiomType{OrderedCompletion DoubleFloat}

```

```

socf2socdf : SOCF -> SOCDF
  ++ socf2socdf(a) is a function to convert a \axiomType{Segment OrderedCompletion Float}
  ++ to a \axiomType{Segment OrderedCompletion DoubleFloat}

convert : List SOCF -> List SOCDF
  ++ convert(l) is a function to convert a \axiomType{Segment OrderedCompletion Float}
  ++ to a \axiomType{Segment OrderedCompletion DoubleFloat}

df2fi : DF -> FI
  ++ df2fi(n) is a function to convert a \axiomType{DoubleFloat} to a
  ++ \axiomType{Fraction Integer}

edf2fi : EDF -> FI
  ++ edf2fi(n) maps \axiomType{Expression DoubleFloat} to
  ++ \axiomType{Fraction Integer}
  ++ It is an error if n is not coercible to Fraction Integer

edf2df : EDF -> DF
  ++ edf2df(n) maps \axiomType{Expression DoubleFloat} to
  ++ \axiomType{DoubleFloat}
  ++ It is an error if \spad{n} is not coercible to DoubleFloat

isQuotient : EDF -> Union(EDF,"failed")
  ++ isQuotient(expr) returns the quotient part of the input
  ++ expression or \spad{"failed"} if the expression is not of that form.

expenseOfEvaluation : VEDF -> F
  ++ expenseOfEvaluation(o) gives an approximation of the cost of
  ++ evaluating a list of expressions in terms of the number of basic
  ++ operations.
  ++ < 0.3 inexpensive ; 0.5 neutral ; > 0.7 very expensive
  ++ 400 'operation units' -> 0.75
  ++ 200 'operation units' -> 0.5
  ++ 83 'operation units' -> 0.25
  ++ ** = 4 units , function calls = 10 units.

numberOfOperations : VEDF -> ON
  ++ numberOfOperations(ode) counts additions, multiplications,
  ++ exponentiations and function calls in the input set of expressions.

edf2efi : EDF -> EFI
  ++ edf2efi(e) coerces \axiomType{Expression DoubleFloat} into
  ++ \axiomType{Expression Fraction Integer}

dfRange : SOCDF -> SOCDF
  ++ dfRange(r) converts a range including
  ++ \inputbitmap{\htbmdir{}/plusminus.bitmap} \infty
  ++ to \axiomType{DoubleFloat} equivalents.

```

```

dflist : List(Record(left:FI,right:FI)) -> LDF
  ++ dflist(l) returns a list of \axiomType{DoubleFloat} equivalents of list l

df2mf : DF -> MF
  ++ df2mf(n) coerces a \axiomType{DoubleFloat} to \axiomType{MachineFloat}

ldf2vmf : LDF -> VMF
  ++ ldf2vmf(l) coerces a \axiomType{List DoubleFloat} to
  ++ \axiomType{List MachineFloat}

edf2ef : EDF -> EF
  ++ edf2ef(e) maps \axiomType{Expression DoubleFloat} to
  ++ \axiomType{Expression Float}

vedf2vef : VEDF -> VEF
  ++ vedf2vef(v) maps \axiomType{Vector Expression DoubleFloat} to
  ++ \axiomType{Vector Expression Float}

in? : (DF,SOCDF) -> Boolean
  ++ in?(p,range) tests whether point p is internal to the
  ++ range range

df2st : DF -> ST
  ++ df2st(n) coerces a \axiomType{DoubleFloat} to \axiomType{String}

f2st : F -> ST
  ++ f2st(n) coerces a \axiomType{Float} to \axiomType{String}

ldf2lst : LDF -> LST
  ++ ldf2lst(ln) coerces a \axiomType{List DoubleFloat} to \axiomType{List String}

sdf2lst : SDF -> LST
  ++ sdf2lst(ln) coerces a \axiomType{Stream DoubleFloat} to \axiomType{String}

getlo : SOCDF -> DF
  ++ getlo(u) gets the \axiomType{DoubleFloat} equivalent of
  ++ the first endpoint of the range \spad{u}

gethi : SOCDF -> DF
  ++ gethi(u) gets the \axiomType{DoubleFloat} equivalent of
  ++ the second endpoint of the range \spad{u}

concat : (Result,Result) -> Result
  ++ concat(a,b) adds two aggregates of type \axiomType{Result}.

concat : (List Result) -> Result
  ++ concat(l) concatenates a list of aggregates of type \axiomType{Result}

outputMeasure : F -> ST
  ++ outputMeasure(n) rounds \spad{n} to 3 decimal places and outputs

```

```

++ it as a string

measure2Result : Measure -> Result
++ measure2Result(m) converts a measure record into a \axiomType{Result}

measure2Result : Measure2 -> Result
++ measure2Result(m) converts a measure record into a \axiomType{Result}

att2Result : ATT -> Result
++ att2Result(m) converts a attributes record into a \axiomType{Result}

iflist2Result : IFV -> Result
++ iflist2Result(m) converts attributes record into a \axiomType{Result}

pdf2ef : PDF -> EF
++ pdf2ef(p) coerces a \axiomType{Polynomial DoubleFloat} to
++ \axiomType{Expression Float}

pdf2df : PDF -> DF
++ pdf2df(p) coerces a \axiomType{Polynomial DoubleFloat} to
++ \axiomType{DoubleFloat}. It is an error if \axiom{p} is not
++ retractable to DoubleFloat.

df2ef : DF -> EF
++ df2ef(a) coerces a \axiomType{DoubleFloat} to
++ \axiomType{Expression Float}

fi2df : FI -> DF
++ fi2df(f) coerces a \axiomType{Fraction Integer} to
++ \axiomType{DoubleFloat}

mat : (LDF,NNI) -> MDF
++ mat(a,n) constructs a one-dimensional matrix of a.

package EXPRSOL ExpressionSolve

Bugs

```
seriesSolve(sin f x / cos x, f, x, [1])$EXPRSOL(INT, EXPR INT, UFPS EXPR INT, UFPS SUPEXPR EXPR INT)
```

returns

```
((0 . 1) 0 . 1) NonNullStream #<compiled-function |STREAM;generate;M$;62!0|> . UNPRINTABLE)
```

but

```
U ==> UFPS SUPEXPR EXPR INT
```

```
seriesSolve(s +-> sin s *((cos monomial(1,1)$U)**-1)$U, f, x, [0])$EXPRSOL(INT, EXPR INT, UFPS EXPR INT, UFPS SUPEXPR EXPR INT)
```

works. This is probably due to missing “/” in UFPS.

I’d really like to be able to specify a function that works for all domains in a category. For example, $x \mapsto y(x)^2 + \sin x + x$ should work for `EXPR INT` as well as for `UTS INT`, both being domains having `TranscendentalFunctionCategory`.

—————

The general method is to transform the given expression into a form which can then be compiled. There is currently no other way in Axiom to transform an expression into a function.

We need to replace the differentiation operator by the corresponding function in the power series category, and make composition explicit. Furthermore, we need to replace the variable by the corresponding variable in the power series. It turns out that the compiler doesn't find the right definition of `monomial(1,1)`. Thus we introduce it as a second argument. In fact, maybe that's even cleaner. Also, we need to tell the compiler that kernels that are independent of the main variable should be coerced to elements of the coefficient ring, since it will complain otherwise.

I cannot find an example for this behaviour right now. However, if I do use the `coerce`, the following fails:

```
seriesSolve(h x -1-x*h x *h(q*x), h, x, [1])
```

— package **EXPRSOL** ExpressionSolve —

SIG ==> with

taylor : SY -> Any
++ \spad{taylor(x)} returns x viewed as a Taylor series.

taylor : FE -> Any
++ \spad{taylor(f)} returns a Taylor expansion of the expression f.
++ Note that f should have only one variable; the series will be
++ expanded in powers of that variable.

taylor : (FE,NNI) -> Any
++ \spad{taylor(f,n)} returns a Taylor expansion of the expression f.
++ Note that f should have only one variable; the series will be
++ expanded in powers of that variable and terms will be computed
++ up to order at least n.

taylor : (FE,EQ FE) -> Any
++ \spad{taylor(f,x = a)} expands the expression f as a Taylor series
++ in powers of \spad{(x - a)}.

taylor : (FE,EQ FE,NNI) -> Any

```

```

++ \spad{taylor(f,x = a)} expands the expression f as a Taylor series
++ in powers of \spad{(x - a)}; terms will be computed up to order
++ at least n.

laurent : SY -> Any
++ \spad{laurent(x)} returns x viewed as a Laurent series.

laurent : FE -> Any
++ \spad{laurent(f)} returns a Laurent expansion of the expression f.
++ Note that f should have only one variable; the series will be
++ expanded in powers of that variable.

laurent : (FE,I) -> Any
++ \spad{laurent(f,n)} returns a Laurent expansion of the expression f.
++ Note that f should have only one variable; the series will be
++ expanded in powers of that variable and terms will be computed
++ up to order at least n.

laurent : (FE,EQ FE) -> Any
++ \spad{laurent(f,x = a)} expands the expression f as a Laurent series
++ in powers of \spad{(x - a)}.

laurent : (FE,EQ FE,I) -> Any
++ \spad{laurent(f,x = a,n)} expands the expression f as a Laurent
++ series in powers of \spad{(x - a)}; terms will be computed up to order
++ at least n.

puiseux : SY -> Any
++ \spad{puiseux(x)} returns x viewed as a Puiseux series.

puiseux : FE -> Any
++ \spad{puiseux(f)} returns a Puiseux expansion of the expression f.
++ Note that f should have only one variable; the series will be
++ expanded in powers of that variable.

puiseux : (FE,RN) -> Any
++ \spad{puiseux(f,n)} returns a Puiseux expansion of the expression f.
++ Note that f should have only one variable; the series will be
++ expanded in powers of that variable and terms will be computed
++ up to order at least n.

puiseux : (FE,EQ FE) -> Any
++ \spad{puiseux(f,x = a)} expands the expression f as a Puiseux series
++ in powers of \spad{(x - a)}.

puiseux : (FE,EQ FE,RN) -> Any
++ \spad{puiseux(f,x = a,n)} expands the expression f as a Puiseux
++ series in powers of \spad{(x - a)}; terms will be computed up to order
++ at least n.

```

```

series : SY -> Any
  ++ \spad{series(x)} returns x viewed as a series.

series : FE -> Any
  ++ \spad{series(f)} returns a series expansion of the expression f.
  ++ Note that f should have only one variable; the series will be
  ++ expanded in powers of that variable.

series : (FE,RN) -> Any
  ++ \spad{series(f,n)} returns a series expansion of the expression f.
  ++ Note that f should have only one variable; the series will be
  ++ expanded in powers of that variable and terms will be computed
  ++ up to order at least n.

series : (FE,EQ FE) -> Any
  ++ \spad{series(f,x = a)} expands the expression f as a series
  ++ in powers of (x - a).

series : (FE,EQ FE,RN) -> Any
  ++ \spad{series(f,x = a,n)} expands the expression f as a series
  ++ in powers of (x - a); terms will be computed up to order
  ++ at least n.

ExpressionTubePlot (EXPRTUBE)

Exports:

constantToUnaryFunction tubePlot

— package EXPRTUBE ExpressionTubePlot —

```

)abbrev package EXPRTUBE ExpressionTubePlot
++ Author: Clifton J. Williamson
++ Date Created: Bastille Day 1989
++ Date Last Updated: 5 June 1990
++ Description:
++ Package for constructing tubes around 3-dimensional parametric curves.

ExpressionTubePlot() : SIG == CODE where

  B ==> Boolean
  I ==> Integer
  FE ==> Expression Integer
  SY ==> Symbol
  SF ==> DoubleFloat
  L ==> List
  S ==> String
  SEG ==> Segment
  F2F ==> MakeFloatCompiledFunction(FE)
  Pt ==> Point SF
  PLOT3 ==> Plot3D
  TUBE ==> TubePlot Plot3D

SIG ==> with

  constantToUnaryFunction : SF -> (SF -> SF)
  ++ constantToUnaryFunction(s) is a local function which takes the
  ++ value of s, which may be a function of a constant, and returns
  ++ a function which always returns the value \spadtype{DoubleFloat} s.

  tubePlot : (FE,FE,FE,SF -> SF,SEG SF,SF -> SF,I) -> TUBE
  
```

```

++ tubePlot(f,g,h,colorFcn,a..b,r,n) puts a tube of radius r(t) with
++ n points on each circle about the curve \spad{x = f(t)},
++ \spad{y = g(t)}, \spad{z = h(t)} for t in \spad{[a,b]}.
++ The tube is considered to be open.

tubePlot : (FE,FE,FE,SF -> SF,SEG SF,SF -> SF,I,S) -> TUBE
++ tubePlot(f,g,h,colorFcn,a..b,r,n,s) puts a tube of radius \spad{r(t)}
++ with n points on each circle about the curve \spad{x = f(t)},
++ \spad{y = g(t)},
++ \spad{z = h(t)} for t in \spad{[a,b]}. If s = "closed", the tube is
++ considered to be closed; if s = "open", the tube is considered
++ to be open.

tubePlot : (FE,FE,FE,SF -> SF,SEG SF,SF,I) -> TUBE
++ tubePlot(f,g,h,colorFcn,a..b,r,n) puts a tube of radius r with
++ n points on each circle about the curve \spad{x = f(t)},
++ \spad{y = g(t)}, \spad{z = h(t)} for t in \spad{[a,b]}.
++ The tube is considered to be open.

tubePlot : (FE,FE,FE,SF -> SF,SEG SF,SF,I,S) -> TUBE
++ tubePlot(f,g,h,colorFcn,a..b,r,n,s) puts a tube of radius r with
++ n points on each circle about the curve \spad{x = f(t)},
++ \spad{y = g(t)}, \spad{z = h(t)} for t in \spad{[a,b]}.
++ If s = "closed", the tube is
++ considered to be closed; if s = "open", the tube is considered
++ to be open.

NOA ==> Record(fn:EDF, init:LDF, lb:LOCDF, cf:LEDF, ub:LOCDF)
LSA ==> Record(lfn:LEDF, init:LDF)

SIG ==> with

finiteBound : (LOCDF,DF) -> LDF
  ++ finiteBound(l,b) repaces all instances of an infinite entry in
  ++ \axiom{l} by a finite entry \axiom{b} or \axiom{-b}.

sortConstraints : NOA -> NOA
  ++ sortConstraints(args) uses a simple bubblesort on the list of
  ++ constraints using the degree of the expression on which to sort.
  ++ Of course, it must match the bounds to the constraints.

sumOfSquares : EDF -> Union(EDF,"failed")
  ++ sumOfSquares(f) returns either an expression for which the square is
  ++ the original function of "failed".

splitLinear : EDF -> EDF
  ++ splitLinear(f) splits the linear part from an expression which it
  ++ returns.

simpleBounds? : LEDF -> Boolean
  ++ simpleBounds?(l) returns true if the list of expressions l are
  ++ simple.

linear? : LEDF -> Boolean
  ++ linear?(l) returns true if all the bounds l are either linear or
  ++ simple.

linear? : EDF -> Boolean
  ++ linear?(e) tests if \axiom{e} is a linear function.

linearMatrix : (LEDF, NNI) -> MDF
  ++ linearMatrix(l,n) returns a matrix of coefficients of the linear
  ++ functions in \axiom{l}. If l is empty, the matrix has at least one
  ++ row.

linearPart : LEDF -> LEDF
  ++ linearPart(l) returns the list of linear functions of \axiom{l}.

nonLinearPart : LEDF -> LEDF
  ++ nonLinearPart(l) returns the list of non-linear functions of l.

quadratic? : EDF -> Boolean
  ++ quadratic?(e) tests if \axiom{e} is a quadratic function.

```

```

variables : LSA -> LS
  ++ variables(args) returns the list of variables in \axiom{args.lfn}

varList : (EDF,NNI) -> LS
  ++ varList(e,n) returns a list of \axiom{n} indexed variables with name
  ++ as in \axiom{e}.

changeNameToObjf : (Symbol,Result) -> Result
  ++ changeNameToObjf(s,r) changes the name of item \axiom{s} in \axiom{r}
  ++ to objf.

expenseOfEvaluation : LSA -> F
  ++ expenseOfEvaluation(o) returns the intensity value of the
  ++ cost of evaluating the input set of functions. This is in terms
  ++ of the number of ‘‘operational units’’. It returns a value
  ++ in the range [0,1].

optAttributes : Union(noa:NOA,lsa:LSA) -> List String
  ++ optAttributes(o) is a function for supplying a list of attributes
  ++ of an optimization problem.

=====

FactoredFunctions2 examples

=====

FactoredFunctions2 contains functions that involve factored objects whose underlying domains may not be the same. For example, map might be used to coerce an object of type Factored(Integer) to Factored(Complex(Integer)).

The FactoredFunctions2 package implements one operation, map, for applying an operation to every base in a factored object and to the unit.

```

double(x) == x + x
                                Type: Void

f := factor(720)
   4 2
   2 3 5
                                Type: Factored Integer

```

Actually, the map operation used in this example comes from Factored itself, since double takes an integer argument and returns an integer result.

```

map(double,f)
   4 2
   2 4 6 10
                                Type: Factored Integer

```

If we want to use an operation that returns an object that has a type different from the operation's argument, the map in Factored cannot be used and we use the one in FactoredFunctions2.

```

makePoly(b) == x + b

```

```

      4      2
(x + 1)(x + 2) (x + 3) (x + 5)
      Type: Factored Polynomial Integer

```

In fact, the "2" in the name of the package means that we might be using factored objects of two different types.

```
g := map(makePoly,f)
```

It is important to note that both versions of map destroy any information known about the bases (the fact that they are prime, for instance).

The flags for each base are set to "nil" in the object returned by map.

```

nthFlag(g,1)
  "nil"
      Type: Union("nil",...)

```

++ Author: Barry Trager
++ Date Created: March 12, 1992
++ Description:
++ This package provides utilities used by the factorizers
++ which operate on polynomials represented as univariate polynomials
++ with multivariate coefficients.

FactoringUtilities(E,OV,R,P) : SIG == CODE where
  E : OrderedAbelianMonoidSup
  OV : OrderedSet
  R : Ring
  P : PolynomialCategory(R,E,OV)

SUP ==> SparseUnivariatePolynomial
NNI ==> NonNegativeInteger
Z  ==> Integer

SIG ==> with

  completeEval : (SUP P,List OV,List R) -> SUP R
    ++ completeEval(upoly, lvar, lval) evaluates the polynomial upoly
    ++ with each variable in lvar replaced by the corresponding value
    ++ in lval. Substitutions are done for all variables in upoly
    ++ producing a univariate polynomial over R.

  degree : (SUP P,List OV) -> List NNI
    ++ degree(upoly, lvar) returns a list containing the maximum
    ++ degree for each variable in lvar.

  variables : SUP P -> List OV
    ++ variables(upoly) returns the list of variables for the coefficients
    ++ of upoly.

  lowerPolynomial : SUP P -> SUP R
    ++ lowerPolynomial(upoly) converts upoly to be a univariate polynomial
    ++ over R. An error if the coefficients contain variables.

  raisePolynomial : SUP R -> SUP P
    ++ raisePolynomial(rpoly) converts rpoly from a univariate polynomial
    ++ over r to be a univariate polynomial with polynomial coefficients.

  normalDeriv : (SUP P,Z) -> SUP P
    ++ normalDeriv(poly,i) computes the ith derivative of poly divided
    ++ by i!.

  ran : Z -> R
    ++ ran(k) computes a random integer between -k and k as member of R.

CODE ==> add

```

```

=====
FiniteFieldFactorizationWithSizeParseBySideEffect examples
=====

```

Part of the package for Algebraic Function Fields in one variable (PAFF)

It has been modified (very slightly) so that each time the "factor" function is used, the variable related to the size of the field over which the polynomial is factorized is reset. This is done in order to be used with a "dynamic extension field" which size is not fixed but set before calling the "factor" function and which is parse by side effect to this package via the function "size". See the local function "initialize" of this package.

FiniteFieldFunctions examples

=====

FiniteFieldFunctions(GF) is a package with functions concerning finite extension fields of the finite ground field GF, for example Zech logarithms.

See Also:

o)show FiniteFieldFunctions

—————→

FiniteFieldFunctions (FFF)

Exports:

createLowComplexityNormalBasis	createLowComplexityTable	createMultiplicationMatrix
createMultiplicationTable	createZechTable	sizeMultiplication

See: Grabmeier[Grab92], Lidl[lidl83]

— package **FFF** FiniteFieldFunctions —

```

)abbrev package FFF FiniteFieldFunctions
++ Author: J. Grabmeier, A. Scheerhorn
++ Date Created: 21 March 1991
++ Date Last Updated: 31 March 1991
++ References:
++ Grab92 Finite Fields in Axiom
++ Lidl83 Finite Field, Encyclopedia of Mathematics and Its Applications
++ Description:
++ FiniteFieldFunctions(GF) is a package with functions
++ concerning finite extension fields of the finite ground field GF,
++ for example, Zech logarithms.
  
```

```

FiniteFieldFunctions(GF) : SIG == CODE where
  GF : FiniteFieldCategory -- the ground field
  
```

```

PI ==> PositiveInteger

SAE ==> SimpleAlgebraicExtension
ARR ==> PrimitiveArray(SI)
TERM ==> Record(value:GF,index:SI)
MM ==> ModMonic(GF,SUP)
PF ==> PrimeField

SIG ==> with

createZechTable : SUP -> ARR
++ createZechTable(f) generates a Zech logarithm table for the cyclic
++ group representation of a extension of the ground field by the
++ primitive polynomial f(x), \spad{Z(i)},
++ defined by  $x^{Z(i)} = 1+x^{i}$  is stored at index i.
++ This is needed in particular
++ to perform addition of field elements in finite fields represented
++ in this way. See \spadtype{FFCGP}, \spadtype{FFCGX}.

createMultiplicationTable : SUP -> V L TERM
++ createMultiplicationTable(f) generates a multiplication
++ table for the normal basis of the field extension determined
++ by f. This is needed to perform multiplications
++ between elements represented as coordinate vectors to this basis.
++ See \spadtype{FFNBP}, \spadtype{FFNBX}.

createMultiplicationMatrix : V L TERM -> M GF
++ createMultiplicationMatrix(m) forms the multiplication table
++ m into a matrix over the ground field.
-- only useful for the user to visualise the multiplication table
-- in a nice form

sizeMultiplication : V L TERM -> NNI
++ sizeMultiplication(m) returns the number of entries
++ of the multiplication table m.
-- the time of the multiplication of field elements depends
-- on this size

createLowComplexityTable : PI -> Union(Vector List TERM,"failed")
++ createLowComplexityTable(n) tries to find
++ a low complexity normal basis of degree n over GF
++ and returns its multiplication matrix

```

```

++ Fails, if it does not find a low complexity basis

createLowComplexityNormalBasis : PI -> Union(SUP, V L TERM)
++ createLowComplexityNormalBasis(n) tries to find a
++ a low complexity normal basis of degree n over GF
++ and returns its multiplication matrix
++ If no low complexity basis is found it calls
++ \axiomFunFrom{createNormalPoly}{FiniteFieldPolynomialPackage}(n)
++ to produce a normal polynomial of degree n over GF

++ Lens87 Primitive Normal Bases for Finite Fields
++ Description:
++ This package provides a number of functions for generating, counting
++ and testing irreducible, normal, primitive, random polynomials
++ over finite fields.

FiniteFieldPolynomialPackage(GF) : SIG == CODE where
  GF : FiniteFieldCategory

  I    ==> Integer
  L    ==> List
  NNI  ==> NonNegativeInteger
  PI   ==> PositiveInteger
  Rec  ==> Record(expnt:NNI, coeff:GF)
  Repr ==> L Rec
  SUP  ==> SparseUnivariatePolynomial GF

  SIG ==> with

--  qEulerPhiCyclotomic : PI -> PI
--    ++ qEulerPhiCyclotomic(n)$FFPOLY(GF) yields the q-Euler's function
--    ++ of the n-th cyclotomic polynomial over the field GF of
--    ++ order q (cf. [LN] p.122);
--    ++ error if n is a multiple of the field characteristic.

primitive? : SUP -> Boolean
++ primitive?(f) tests whether the polynomial f over a finite
++ field is primitive, all its roots are primitive.

normal? : SUP -> Boolean
++ normal?(f) tests whether the polynomial f over a finite field is
++ normal, its roots are linearly independent over the field.

```

```

numberOfIrreduciblePoly : PI -> PI
++ numberOfIrreduciblePoly(n)$FFPOLY(GF) yields the number of
++ monic irreducible univariate polynomials of degree n
++ over the finite field GF.

numberOfPrimitivePoly : PI -> PI
++ numberOfPrimitivePoly(n)$FFPOLY(GF) yields the number of
++ primitive polynomials of degree n over the finite field GF.

numberOfNormalPoly : PI -> PI
++ numberOfNormalPoly(n)$FFPOLY(GF) yields the number of
++ normal polynomials of degree n over the finite field GF.

createIrreduciblePoly : PI -> SUP
++ createIrreduciblePoly(n)$FFPOLY(GF) generates a monic irreducible
++ univariate polynomial of degree n over the finite field GF.

createPrimitivePoly : PI -> SUP
++ createPrimitivePoly(n)$FFPOLY(GF) generates a primitive polynomial
++ of degree n over the finite field GF.

createNormalPoly : PI -> SUP
++ createNormalPoly(n)$FFPOLY(GF) generates a normal polynomial
++ of degree n over the finite field GF.

createNormalPrimitivePoly : PI -> SUP
++ createNormalPrimitivePoly(n)$FFPOLY(GF) generates a normal and
++ primitive polynomial of degree n over the field GF.
++ Note that this function is equivalent to createPrimitiveNormalPoly(n)

createPrimitiveNormalPoly : PI -> SUP
++ createPrimitiveNormalPoly(n)$FFPOLY(GF) generates a normal and
++ primitive polynomial of degree n over the field GF.
++ polynomial of degree n over the field GF.

nextIrreduciblePoly : SUP -> Union(SUP, "failed")
++ nextIrreduciblePoly(f) yields the next monic irreducible polynomial
++ over a finite field GF of the same degree as f in the following
++ order, or "failed" if there are no greater ones.
++ Error: if f has degree 0.
++ Note that the input polynomial f is made monic.
++ Also, \spad{f < g} if
++ the number of monomials of f is less
++ than this number for g.
++ If f and g have the same number of monomials,
++ the lists of exponents are compared lexicographically.
++ If these lists are also equal, the lists of coefficients
++ are compared according to the lexicographic ordering induced by
++ the ordering of the elements of GF given by lookup.

```

```

nextPrimitivePoly : SUP -> Union(SUP, "failed")
++ nextPrimitivePoly(f) yields the next primitive polynomial over
++ a finite field GF of the same degree as f in the following
++ order, or "failed" if there are no greater ones.
++ Error: if f has degree 0.
++ Note that the input polynomial f is made monic.
++ Also, \spad{f < g} if the lookup of the constant term
++ of f is less than
++ this number for g.
++ If these values are equal, then \spad{f < g} if
++ if the number of monomials of f is less than that for g or if
++ the lists of exponents of f are lexicographically less than the
++ corresponding list for g.
++ If these lists are also equal, the lists of coefficients are
++ compared according to the lexicographic ordering induced by
++ the ordering of the elements of GF given by lookup.

nextNormalPoly : SUP -> Union(SUP, "failed")
++ nextNormalPoly(f) yields the next normal polynomial over
++ a finite field GF of the same degree as f in the following
++ order, or "failed" if there are no greater ones.
++ Error: if f has degree 0.
++ Note that the input polynomial f is made monic.
++ Also, \spad{f < g} if the lookup of the coefficient
++ of the term of degree
++ n-1 of f is less than that for g.
++ In case these numbers are equal, \spad{f < g} if
++ if the number of monomials of f is less than that for g or if
++ the list of exponents of f are lexicographically less than the
++ corresponding list for g.
++ If these lists are also equal, the lists of coefficients are
++ compared according to the lexicographic ordering induced by
++ the ordering of the elements of GF given by lookup.

nextNormalPrimitivePoly : SUP -> Union(SUP, "failed")
++ nextNormalPrimitivePoly(f) yields the next normal primitive polynomial
++ over a finite field GF of the same degree as f in the following
++ order, or "failed" if there are no greater ones.
++ Error: if f has degree 0.
++ Note that the input polynomial f is made monic.
++ Also, \spad{f < g} if the lookup of the constant
++ term of f is less than
++ this number for g or if
++ lookup of the coefficient of the term of degree n-1
++ of f is less than this number for g.
++ Otherwise, \spad{f < g}
++ if the number of monomials of f is less than
++ that for g or if the lists of exponents for f are
++ lexicographically less than those for g.
++ If these lists are also equal, the lists of coefficients are

```

```

    ++ compared according to the lexicographic ordering induced by
    ++ the ordering of the elements of GF given by lookup.
    ++ This operation is equivalent to nextPrimitiveNormalPoly(f).

nextPrimitiveNormalPoly : SUP -> Union(SUP, "failed")
    ++ nextPrimitiveNormalPoly(f) yields the next primitive normal polynomial
    ++ over a finite field GF of the same degree as f in the following
    ++ order, or "failed" if there are no greater ones.
    ++ Error: if f has degree 0.
    ++ Note that the input polynomial f is made monic.
    ++ Also, \spad{f < g} if the lookup of the
    ++ constant term of f is less than
    ++ this number for g or, in case these numbers are equal, if the
    ++ lookup of the coefficient of the term of degree n-1
    ++ of f is less than this number for g.
    ++ If these numbers are equals, \spad{f < g}
    ++ if the number of monomials of f is less than
    ++ that for g, or if the lists of exponents for f are lexicographically
    ++ less than those for g.
    ++ If these lists are also equal, the lists of coefficients are
    ++ coefficients according to the lexicographic ordering induced by
    ++ the ordering of the elements of GF given by lookup.
    ++ This operation is equivalent to nextNormalPrimitivePoly(f).

random : PI -> SUP
    ++ random(n)$FFPOLY(GF) generates a random monic polynomial
    ++ of degree n over the finite field GF.

random : (PI, PI) -> SUP
    ++ random(m,n)$FFPOLY(GF) generates a random monic polynomial
    ++ of degree d over the finite field GF, d between m and n.

leastAffineMultiple : SUP -> SUP
    ++ leastAffineMultiple(f) computes the least affine polynomial which
    ++ is divisible by the polynomial f over the finite field GF,
    ++ a polynomial whose exponents are 0 or a power of q, the
    ++ size of GF.

reducedQPowers : SUP -> PrimitiveArray SUP
    ++ reducedQPowers(f)
    ++ generates \spad{[x,x**q,x**(q**2),...,x**(q**(n-1))]}
    ++ reduced modulo f where \spad{q = size()$GF} and \spad{n = degree f}.

FiniteLinearAggregateFunctions2 (FLAGG2)**Exports:**

map reduce scan

— package FLAGG2 FiniteLinearAggregateFunctions2 —

```

)abbrev package FLAGG2 FiniteLinearAggregateFunctions2
++ Description:
++ FiniteLinearAggregateFunctions2 provides functions involving two
++ FiniteLinearAggregates where the underlying domains might be
++ different. An example of this might be creating a list of rational
++ numbers by mapping a function across a list of integers where the
++ function divides each integer by 1000.

FiniteLinearAggregateFunctions2(S, A, R, B) : SIG == CODE where
  S : Type
  A : FiniteLinearAggregate S
  R : Type
  B : FiniteLinearAggregate R

SIG ==> with

map : (S -> R, A) -> B
++ map(f,a) applies function f to each member of aggregate
++ \spad{a} resulting in a new aggregate over a
++ possibly different underlying domain.

reduce : ((S, R) -> R, A, R) -> R
++ reduce(f,a,r) applies function f to each
++ successive element of the
++ aggregate \spad{a} and an accumulant initialized to r.
++ For example,
++ \spad{reduce(_+$Integer,[1,2,3],0)}
++ does \spad{3+(2+(1+0))}. Note that third argument r
++ may be regarded as the
++ identity element for the function f.

```

```

scan : ((S, R) -> R, A, R) -> B
++ scan(f,a,r) successively applies
++ \spad{reduce(f,x,r)} to more and more leading sub-aggregates
++ x of aggregate \spad{a}.
++ More precisely, if \spad{a} is \spad{[a1,a2,...]}, then
++ \spad{scan(f,a,r)} returns
++ \spad{[reduce(f,[a1],r),reduce(f,[a1,a2],r),...]}.

SIG ==> with

```

```

map : (S -> R, A) -> B
++ map(f,a) applies function f to each member of
++ aggregate \spad{a}, creating a new aggregate with
++ a possibly different underlying domain.

reduce : ((S, R) -> R, A, R) -> R
++ reduce(f,a,r) applies function f to each
++ successive element of the aggregate \spad{a} and an
++ accumulator initialised to r.
++ For example,
++ \spad{reduce(_+$Integer,[1,2,3],0)}
++ does a \spad{3+(2+(1+0))}.
++ Note that third argument r may be regarded
++ as an identity element for the function.

scan : ((S, R) -> R, A, R) -> B
++ scan(f,a,r) successively applies \spad{reduce(f,x,r)}
++ to more and more leading sub-aggregates x of
++ aggregate \spad{a}.
++ More precisely, if \spad{a} is \spad{[a1,a2,...]}, then
++ \spad{scan(f,a,r)} returns
++ \spad{[reduce(f,[a1],r),reduce(f,[a1,a2],r),...]}.

solve : (L RFI,Par) -> L L EQ P Par
++ solve(lp,eps) finds all of the real solutions of the
++ system lp of rational functions over the rational numbers
++ with respect to all the variables appearing in lp,
++ with precision eps.

solve : (L EQ RFI,Par) -> L L EQ P Par
++ solve(leq,eps) finds all of the real solutions of the
++ system leq of equations of rational functions
++ with respect to all the variables appearing in lp,
++ with precision eps.

solve : (RFI,Par) -> L EQ P Par
++ solve(p,eps) finds all of the real solutions of the
++ univariate rational function p with rational coefficients
++ with respect to the unique variable appearing in p,
++ with precision eps.

solve : (EQ RFI,Par) -> L EQ P Par
++ solve(eq,eps) finds all of the real solutions of the
++ univariate equation eq of rational functions
++ with respect to the unique variables appearing in eq,
++ with precision eps.

realRoots : (L RFI,L SE,Par) -> L L Par
++ realRoots(lp,lv,eps) computes the list of the real
++ solutions of the list lp of rational functions with rational
++ coefficients with respect to the variables in lv,
++ with precision eps. Each solution is expressed as a list
++ of numbers in order corresponding to the variables in lv.

realRoots : (RFI,Par) -> L Par
++ realRoots(rf, eps) finds the real zeros of a univariate
++ rational function with precision given by eps.

```

```

=====
FortranCodePackage1 examples
=====

```

FortranCodePackage1 provides some utilities for producing useful objects in FortranCode domain.

The Package may be used with the FortranCode domain and its printCode or possibly via an outputAsFortran.

The package provides items of use in connection with ASPs in the AXIOM-NAG link and, where appropriate, naming accords with that in IRENA.

The easy-to-use functions use Fortran loop variables I1, I2, and it is users' responsibility to check that this is sensible. The advanced functions use SegmentBinding to allow users control over Fortran loop variable names.

SIG ==> with

fffg : (List D, cFunction, List NonNegativeInteger) -> Matrix SUP D
++ \spad{fffg} is the general algorithm as proposed by Beckermann and
++ Labahn.
++
++ The first argument is the list of  $c_{i,i}$ . These are the only values
++ of  $C$  explicitly needed in \spad{fffg}.
++
++ The second argument  $c$ , computes  $c_k(M)$ ,  $c_k(\cdot)$  is the dual basis
++ of the vector space  $V$ , but also knows about the special multiplication
++ rule as described in Equation (2). Note that the information about  $f$ 
++ is therefore encoded in  $c$ .
++
++ The third argument is the vector of degree bounds  $n$ , as introduced in
++ Definition 2.1. In particular, the sum of the entries is the order of
++ the Mahler system computed.

interpolate : (List D, List D, NonNegativeInteger) -> Fraction SUP D
++ \spad{interpolate}(xlist, ylist, deg) returns the rational function with
++ numerator degree at most \spad{deg} and denominator degree at most
++ \spad{#xlist-deg-1} that interpolates the given points using
++ fraction free arithmetic. Note that rational interpolation does not
++ guarantee that all given points are interpolated correctly:
++ unattainable points may make this impossible.

```

The following function could be moved to FFFGF, parallel to `generalInterpolation`. However, the reason for moving `generalInterpolation` for fractions to a separate package was the need of a generic signature, hence the extra argument `VF` to FFFGF. In the special case of rational interpolation, this extra argument is not necessary, since we are always returning a fraction of SUPs, and ignore V . In fact, V is not needed for `fffg` itself, only if we want to specify a `CoeffAction`.

Thus, maybe it would be better to move fffg to a separate package?

— package FFFG FractionFreeFastGaussian —

```

interpolate: (List Fraction D, List Fraction D, NonNegativeInteger)
  -> Fraction SUP D
++ \spad{interpolate(xlist, ylist, deg)} returns the rational function with
++ numerator degree \spad{deg} that interpolates the given points using
++ fraction free arithmetic.

generalInterpolation: (List D, CoeffAction,
  Vector V, List NonNegativeInteger) -> Matrix SUP D
++ \spad{generalInterpolation(C, CA, f, eta)} performs Hermite-Pade
++ approximation using the given action CA of polynomials on the elements
++ of f. The result is guaranteed to be correct up to order
++ |eta|-1. Given that eta is a "normal" point, the degrees on the
++ diagonal are given by eta. The degrees of column i are in this case
++ eta + e.i - [1,1,...,1], where the degree of zero is -1.
++
++ The first argument C is the list of coefficients c_{k,k} in the
++ expansion <x^k> z g(x) = sum_{i=0}^k c_{k,i} <x^i> g(x).
++
++ The second argument, CA(k, l, f), should return the coefficient of x^k
++ in z^l f(x).

generalInterpolation: (List D, CoeffAction,
  Vector V, NonNegativeInteger, NonNegativeInteger)
  -> Stream Matrix SUP D
++ \spad{generalInterpolation(C, CA, f, sumEta, maxEta)} applies
++ \spad{generalInterpolation(C, CA, f, eta)} for all possible \spad{eta}
++ with maximal entry \spad{maxEta} and sum of entries at most
++ \spad{sumEta}.
++
++ The first argument C is the list of coefficients c_{k,k} in the
++ expansion <x^k> z g(x) = sum_{i=0}^k c_{k,i} <x^i> g(x).
++
++ The second argument, CA(k, l, f), should return the coefficient of x^k
++ in z^l f(x).

generalCoefficient: (CoeffAction, Vector V,
  NonNegativeInteger, Vector SUP D) -> D
++ \spad{generalCoefficient(action, f, k, p)} gives the coefficient of
++ x^k in p(z)\dot f(x), where the action of z^l on a polynomial in x is
++ given by action, action(k, l, f) should return the coefficient
++ of x^k in z^l f(x).

ShiftAction: (NonNegativeInteger, NonNegativeInteger, V) -> D
++ \spad{ShiftAction(k, l, g)} gives the coefficient of x^k in z^l g(x),
++ where \spad{z*(a+b*x+c*x^2+d*x^3+...)} = (b*x+2*c*x^2+3*d*x^3+...). In

```

```

++ terms of sequences,  $z*u(n)=n*u(n)$ .

ShiftC: NonNegativeInteger -> List D
++ \spad{ShiftC} gives the coefficients  $c_{\{k,k\}}$  in the expansion  $\langle x^k \rangle z$ 
++  $g(x) = \sum_{i=0}^k c_{\{k,i\}} \langle x^i \rangle g(x)$ , where  $z$  acts on  $g(x)$  by
++ shifting. In fact, the result is  $[0,1,2,\dots]$ 

DiffAction: (NonNegativeInteger, NonNegativeInteger, V) -> D
++ \spad{DiffAction(k, l, g)} gives the coefficient of  $x^k$  in  $z^l g(x)$ ,
++ where  $z*(a+b*x+c*x^2+d*x^3+\dots) = (a*x+b*x^2+c*x^3+\dots)$ ,
++ multiplication with  $x$ .

DiffC: NonNegativeInteger -> List D
++ \spad{DiffC} gives the coefficients  $c_{\{k,k\}}$  in the expansion  $\langle x^k \rangle z$ 
++  $g(x) = \sum_{i=0}^k c_{\{k,i\}} \langle x^i \rangle g(x)$ , where  $z$  acts on  $g(x)$  by
++ shifting. In fact, the result is  $[0,0,0,\dots]$ 

qShiftAction: (D, NonNegativeInteger, NonNegativeInteger, V) -> D
++ \spad{qShiftAction(q, k, l, g)} gives the coefficient of  $x^k$  in  $z^l$ 
++  $g(x)$ , where  $z*(a+b*x+c*x^2+d*x^3+\dots) =$ 
++  $(a+q*b*x+q^2*c*x^2+q^3*d*x^3+\dots)$ . In terms of sequences,
++  $z*u(n)=q^n*u(n)$ .

qShiftC: (D, NonNegativeInteger) -> List D
++ \spad{qShiftC} gives the coefficients  $c_{\{k,k\}}$  in the expansion  $\langle x^k \rangle z$ 
++  $g(x) = \sum_{i=0}^k c_{\{k,i\}} \langle x^i \rangle g(x)$ , where  $z$  acts on  $g(x)$  by
++ shifting. In fact, the result is  $[1,q,q^2,\dots]$

  fffg(C, c, eta)

```

```
-- general - suitable for functions f - trying all possible degree combinations
```

The following function returns the lexicographically next vector with non-negative components smaller than p with the same sum as v.

— package FFFG FractionFreeFastGaussian —

```
nextVector!(p: NonNegativeInteger, v: List NonNegativeInteger)
  : Union("failed", List NonNegativeInteger) ==
n := #v
pos := position(x +-> x < p, v)
zero? pos => return "failed"
if pos = 1 then
  sum: Integer := v.1
  for i in 2..n repeat
    if v.i < p and sum > 0 then
      v.i := v.i + 1
      sum := sum - 1
      for j in 1..i-1 repeat
        if sum > p then
          v.j := p
          sum := sum - p
        else
          v.j := sum::NonNegativeInteger
          sum := 0
      return v
    else sum := sum + v.i
  return "failed"
else
  v.pos := v.pos + 1
  v.(pos-1) := (v.(pos-1) - 1)::NonNegativeInteger

v
```

The following function returns the stream of all possible degree vectors, beginning with v, where the degree vectors are sorted in reverse lexicographic order. Furthermore, the entries are all less or equal to p and their sum equals the sum of the entries of v. We assume that the entries of v are also all less or equal to p.

— package FFFG FractionFreeFastGaussian —

```

vectorStream(p: NonNegativeInteger, v: List NonNegativeInteger)
  : Stream List NonNegativeInteger == delay
next := nextVector!(p, copy v)
(next case "failed") => empty()$Stream(List NonNegativeInteger)
cons(next, vectorStream(p, next))

```

vectorStream2 skips every second entry of vectorStream.

— package FFFG FractionFreeFastGaussian —

```

vectorStream2(p: NonNegativeInteger, v: List NonNegativeInteger)
  : Stream List NonNegativeInteger == delay
next := nextVector!(p, copy v)
(next case "failed") => empty()$Stream(List NonNegativeInteger)
next2 := nextVector!(p, copy next)
(next2 case "failed") => cons(next, empty())
cons(next2, vectorStream2(p, next2))

```

This version of generalInterpolation returns a stream of solutions, one for each possible degree vector. Thus, it only needs to apply the previously defined generalInterpolation to each degree vector. These are generated by vectorStream and vectorStream2 respectively.

If f consists of two elements only, we can skip every second degree vector: note that fffg, and thus also generalInterpolation, returns a matrix with $\#f$ columns, each corresponding to a solution of the interpolation problem. More precisely, the i^{th} column is a solution with degrees $\eta - (1, 1, \dots, 1) + e_i$. Thus, in the case of 2×2 matrices, vectorStream would produce solutions corresponding to $(d, 0), (d-1, 1); (d-1, 1), (d-2, 2); (d-2, 2), (d-3, 3) \dots$, every second matrix is redundant.

Although some redundancy exists also for higher dimensional f , the scheme becomes much more complicated, thus we did not implement it.

— package FFFG FractionFreeFastGaussian —

```

generalInterpolation(C: List D, coeffAction: CoeffAction,
  f: Vector V,
  sumEta: NonNegativeInteger,
  maxEta: NonNegativeInteger)
  : Stream Matrix SUP D ==

\getchunk{generate an initial degree vector}

if #f = 2 then
  map(x +-> generalInterpolation(C, coeffAction, f, x),
    cons(eta, vectorStream2(maxEta, eta)))

```

— generate an initial degree vector —

— BUG generate an initial degree vector —

[illegible]

```

r := interpolate(gx.num, gy.num, d)
elt(numer r, monomial(gx.den, 1)) / (gy.den * elt(denom r, monomial(gx.den, 1)))

interpolate(x: List D, y: List D, d: NonNegativeInteger): Fraction SUP D ==
-- berechne Interpolante mit Graden d und N-d-1
if (N := #x) ~= #y then

M := fffg(x, c, eta)
if zero?(M.(2,1)) then M.(1,2)/M.(2,2)
  else M.(1,1)/M.(2,1)

```

Because of Lemma 5.3, M.1.(2,1) and M.1.(2,2) cannot both vanish, since `eta_sigma` is always σ -normal by Theorem 7.2 and therefore also para-normal, see Definition 4.2.

Because of Lemma 5.1 we have that M.1.(*,2) is a solution of the interpolation problem, if M.1.(2,1) vanishes.

— package **FFFG FractionFreeFastGaussian** —

```

-----
-- fffg
-----

```

recurrence computes the new matrix M , according to the following formulas (cf. Table 2 in Beckermann and Labahn):

$$\begin{aligned}
& \text{Increase order} \\
& \text{for } \ell = 1 \dots m, \ell \neq \pi \\
\mathbf{M}_{\sigma+1}^{(\cdot, \ell)} &:= \left(\mathbf{M}_{\sigma}^{(\cdot, \ell)} r^{(\pi)} - \mathbf{M}_{\sigma}^{(\cdot, \pi)} r^{(\ell)} \right) / d_{\sigma} \\
& \text{Increase order in column } \pi \\
\mathbf{M}_{\sigma+1}^{(\cdot, \pi)} &:= (z - c_{\sigma, \sigma}) \mathbf{M}_{\sigma}^{(\cdot, \pi)} \\
& \text{Adjust degree constraints:} \\
\mathbf{M}_{\sigma+1}^{(\cdot, \pi)} &:= \left(\mathbf{M}_{\sigma+1}^{(\cdot, \pi)} r^{(\pi)} - \sum_{\ell \neq \pi} \mathbf{M}_{\sigma+1}^{(\cdot, \ell)} p^{(\ell)} \right) / d_{\sigma}
\end{aligned}$$

Since we do not need the matrix $\mathbf{M}_{\sigma}$ anymore, we drop the index and update the matrix destructively. In the following, we write C_k for $c_{\sigma, \sigma}$.

— package **FFFG FractionFreeFastGaussian** —

— package FSPECF FunctionalSpecialFunction —

```

)abbrev package FSPECF FunctionalSpecialFunction
++ Author: Manuel Bronstein
++ Date Created: 18 Apr 1989
++ Date Last Updated: 4 October 1993
++ Description:
  
```

```

++ Provides some special functions over an integral domain.

FunctionalSpecialFunction(R, F) : SIG == CODE where
  R : Join(OrderedSet, IntegralDomain)
  F : FunctionSpace R

  OP ==> BasicOperator
  K  ==> Kernel F
  SE ==> Symbol
  SPECIALDIFF ==> "%specialDiff"

  SIG ==> with

    belong? : OP -> Boolean
      ++ belong?(op) is true if op is a special function operator;

    operator : OP -> OP
      ++ operator(op) returns a copy of op with the domain-dependent
      ++ properties appropriate for F;
      ++ error if op is not a special function operator

    abs : F -> F
      ++ abs(f) returns the absolute value operator applied to f

    Gamma : F -> F
      ++ Gamma(f) returns the formal Gamma function applied to f

    Gamma : (F,F) -> F
      ++ Gamma(a,x) returns the incomplete Gamma function applied to a and x

    Beta : (F,F) -> F
      ++ Beta(x,y) returns the beta function applied to x and y

    digamma : F->F
      ++ digamma(x) returns the digamma function applied to x

    polygamma : (F,F) ->F
      ++ polygamma(x,y) returns the polygamma function applied to x and y

    bessellJ : (F,F) -> F
      ++ bessellJ(x,y) returns the bessellj function applied to x and y

    bessellY : (F,F) -> F
      ++ bessellY(x,y) returns the besselly function applied to x and y

    bessellI : (F,F) -> F
      ++ bessellI(x,y) returns the besselli function applied to x and y

    bessellK : (F,F) -> F
      ++ bessellK(x,y) returns the bessellk function applied to x and y

```

```

airyAi : F -> F
  ++ airyAi(x) returns the airyai function applied to x

airyBi : F -> F
  ++ airyBi(x) returns the airybi function applied to x

```

In case we want to have more special function operators here, do not forget to add them to the list specop in CommonOperators. Otherwise they will not have the 'special' attribute and will not be recognised here. One effect could be that

```
myNewSpecOp(1::Expression Integer)::Expression DoubleFloat
```

might not re-evaluate the operator.

differentiation of special functions

In the following we define the symbolic derivatives of the special functions we provide. The formulas we use for the Bessel functions can be found in Milton Abramowitz and Irene A. Stegun, eds. (1965). Handbook of Mathematical Functions with Formulas, Graphs, and Mathematical Tables. New York: Dover. ISBN 0-486-61272-4, Equations 9.1.27 and 9.6.26. Up to patch-50 the formula for K missed the minus sign. (Issue #355)

We do not attempt to provide formulas for the derivative with respect to the first argument currently. Instead, we leave such derivatives unevaluated.

— package FSPECF FunctionalSpecialFunction —

```

import Fraction Integer
ahalf: F      := recip(2::F)::F
athird: F     := recip(2::F)::F
twothirds: F := 2*recip(3::F)::F

```

We need to get hold of the differentiation operator as modified by FunctionSpace. Otherwise, for example, display will be ugly. We accomplish that by differentiating an operator, which will certainly result in a single kernel only.

— package FSPECF FunctionalSpecialFunction —

```

dummyArg: SE := new()$SE
opdiff := operator first kernels D((operator(new()$SE)$BasicOperator)
                                   (dummyArg::F), dummyArg)

```

The differentiation operator opdiff takes three arguments corresponding to

$$F_{,i}(a_1, a_2, \dots, a_n) :$$

1. $F(a_1, \dots, dm, \dots a_n)$, where the i^{th} argument is a dummy variable,
2. dm , the dummy variable, and
3. a_i , the point at which the differential is evaluated.

In the following, it seems to be safe to use the same dummy variable throughout. At least, this is done also in FunctionSpace, and did not cause problems.

The operation symbolicGrad returns the first component of the gradient of op l.

— package FSPECF FunctionalSpecialFunction —

```
dm := new()$SE :: F

iBesselJ(l: List F, t: SE): F ==
  n := first l; x := second l
  differentiate(n, t)*kernel(opdiff, [opBesselJ [dm, x], dm, n])
  + differentiate(x, t) * ahalf * (besselJ (n-1,x) - besselJ (n+1,x))

iBesselY(l: List F, t: SE): F ==
  n := first l; x := second l
  differentiate(n, t)*kernel(opdiff, [opBesselY [dm, x], dm, n])
  + differentiate(x, t) * ahalf * (besselY (n-1,x) - besselY (n+1,x))

iBesselI(l: List F, t: SE): F ==
  n := first l; x := second l
  differentiate(n, t)*kernel(opdiff, [opBesselI [dm, x], dm, n])
  + differentiate(x, t)* ahalf * (besselI (n-1,x) + besselI (n+1,x))

iBesselK(l: List F, t: SE): F ==
  n := first l; x := second l
  differentiate(n, t)*kernel(opdiff, [opBesselK [dm, x], dm, n])
  - differentiate(x, t)* ahalf * (besselK (n-1,x) + besselK (n+1,x))
```

For the moment we throw an error if we try to differentiate polygamma with respect to the first argument.

— package FSPECF FunctionalSpecialFunction —

```
ipolygamma(l: List F, x: SE): F ==
  member?(x, variables first l) =>
    error "cannot differentiate polygamma with respect to the first argument"
  n := first l; y := second l
  differentiate(y, x)*polygamma(n+1, y)
iBetaGrad1(l: List F): F ==
```

```

      x := first l; y := second l
      Beta(x,y)*(digamma x - digamma(x+y))
iBetaGrad2(l: List F): F ==
  x := first l; y := second l
  Beta(x,y)*(digamma y - digamma(x+y))

if F has ElementaryFunctionCategory then
  iGamma2(l: List F, t: SE): F ==
    a := first l; x := second l
    differentiate(a, t)*kernel(opdiff, [opGamma2 [dm, x], dm, a])
    - differentiate(x, t)* x ** (a - 1) * exp(-x)
  setProperty(opGamma2, SPECIALDIFF, iGamma2@((List F, SE)->F)
    pretend None)

```

Finally, we tell Axiom to use these functions for differentiation. Note that up to patch-50, the properties for the Bessel functions were set using `derivative(oppolygamma, [lzero, ipolygammaGrad])`, where `lzero` returned zero always. Trying to replace `lzero` by a function that returns the first component of the gradient failed, it resulted in an infinite loop for `integrate(D(besselJ(a,x),a),a)`.

— package FSPECF FunctionalSpecialFunction —

```

derivative(opabs,      (x:F):F +-> abs(x) * inv(x))
derivative(opGamma,    (x:F):F +-> digamma x * Gamma x)
derivative(opBeta,     [iBetaGrad1, iBetaGrad2])
derivative(opdigamma,  (x:F):F +-> polygamma(1, x))
setProperty(oppolygamma, SPECIALDIFF, ipolygamma@((List F, SE)->F)
  pretend None)
setProperty(opBesselJ, SPECIALDIFF, iBesselJ@((List F, SE)->F)
  pretend None)
setProperty(opBesselY, SPECIALDIFF, iBesselY@((List F, SE)->F)
  pretend None)
setProperty(opBesselI, SPECIALDIFF, iBesselI@((List F, SE)->F)
  pretend None)
setProperty(opBesselK, SPECIALDIFF, iBesselK@((List F, SE)->F)
  pretend None)

```

FunctionFieldIntegralBasis examples

=====

Integral bases for function fields of dimension one
 In this package R is a Euclidean domain and F is a framed algebra
 over R. The package provides functions to compute the integral
 closure of R in the quotient field of F. It is assumed that
 $\text{char}(R/P) = \text{char}(R)$ for any prime P of R. A typical instance of
 this is when $R = K[x]$ and F is a function field over R.

++ Description:
++ Integral bases for function fields of dimension one
++ In this package R is a Euclidean domain and F is a framed algebra
++ over R. The package provides functions to compute the integral
++ closure of R in the quotient field of F. It is assumed that
++ \spad{char(R/P) = char(R)} for any prime P of R. A typical instance of
++ this is when \spad{R = K[x]} and F is a function field over R.

FunctionFieldIntegralBasis(R,UP,F) : SIG == CODE where
  R : EuclideanDomain with

      squareFree: $ -> Factored $
      ++ squareFree(x) returns a square-free factorisation of x

  UP : UnivariatePolynomialCategory R
  F : FramedAlgebra(R,UP)

  I ==> Integer
  Mat ==> Matrix R
  NNI ==> NonNegativeInteger

  SIG ==> with

      integralBasis : () -> Record(basis: Mat, basisDen: R, basisInv:Mat)
      ++ \spad{integralBasis()} returns a record
      ++ \spad{[basis,basisDen,basisInv]} containing information regarding

```

```

++ the integral closure of R in the quotient field of F, where
++ F is a framed algebra with R-module basis \spad{w1,w2,...,wn}.
++ If \spad{basis} is the matrix \spad{(aij, i = 1..n, j = 1..n)}, then
++ the \spad{i}th element of the integral basis is
++ \spad{vi = (1/basisDen) * sum(aij * wj, j = 1..n)}, the
++ \spad{i}th row of \spad{basis} contains the coordinates of the
++ \spad{i}th basis vector. Similarly, the \spad{i}th row of the
++ matrix \spad{basisInv} contains the coordinates of \spad{wi} with
++ respect to the basis \spad{v1,...,vn}: if \spad{basisInv} is the
++ matrix \spad{(bij, i = 1..n, j = 1..n)}, then
++ \spad{wi = sum(bij * vj, j = 1..n)}.

```

```

localIntegralBasis : R -> Record(basis: Mat, basisDen: R, basisInv:Mat)
++ \spad{integralBasis(p)} returns a record
++ \spad{[basis,basisDen,basisInv]} containing information regarding
++ the local integral closure of R at the prime \spad{p} in the quotient
++ field of F, where F is a framed algebra with R-module basis
++ \spad{w1,w2,...,wn}.
++ If \spad{basis} is the matrix \spad{(aij, i = 1..n, j = 1..n)}, then
++ the \spad{i}th element of the local integral basis is
++ \spad{vi = (1/basisDen) * sum(aij * wj, j = 1..n)}, the
++ \spad{i}th row of \spad{basis} contains the coordinates of the
++ \spad{i}th basis vector. Similarly, the \spad{i}th row of the
++ matrix \spad{basisInv} contains the coordinates of \spad{wi} with
++ respect to the basis \spad{v1,...,vn}: if \spad{basisInv} is the
++ matrix \spad{(bij, i = 1..n, j = 1..n)}, then
++ \spad{wi = sum(bij * vj, j = 1..n)}.

++ Author: Manuel Bronstein
++ Date Created: 6 Jun 1990
++ Date Last Updated: 25 April 1991
++ Description:
++ FunctionsSpacePrimitiveElement provides functions to compute
++ primitive elements in functions spaces;

FunctionSpacePrimitiveElement(R, F) : SIG == CODE where
  R : Join(IntegralDomain, OrderedSet, CharacteristicZero)
  F : FunctionSpace R

SY ==> Symbol
P ==> Polynomial F
K ==> Kernel F
UP ==> SparseUnivariatePolynomial F
REC ==> Record(primelt:F, poly:List UP, prim:UP)

SIG ==> with

primitiveElement : List F -> Record(primelt:F, poly:List UP, prim:UP)
++ primitiveElement([a1,...,an]) returns \spad{[a, [q1,...,qn], q]}
++ such that then \spad{k(a1,...,an) = k(a)},
++ \spad{ai = qi(a)}, and \spad{q(a) = 0}.
++ This operation uses the technique of
++ \spadglossSee{groebner bases}{Groebner basis}.

if F has AlgebraicallyClosedField then

primitiveElement : (F,F)->Record(primelt:F,pol1:UP,pol2:UP,prim:UP)
++ primitiveElement(a1, a2) returns \spad{[a, q1, q2, q]}
++ such that \spad{k(a1, a2) = k(a)},
++ \spad{ai = qi(a)}, and \spad{q(a) = 0}.
++ The minimal polynomial for a2 may involve a1, but the
++ minimal polynomial for a1 may not involve a2;
++ This operations uses \spadfun{resultant}.

=====

FunctionSpaceToUnivariatePowerSeries examples

=====

This package converts expressions in some function space to power series in a variable x with coefficients in that function space. The function `exprToUPS` converts expressions to power series whose coefficients do not contain the variable x . The function `exprToGenUPS` converts functional expressions to power series whose coefficients may involve functions of $\log(x)$.

exprToUPS : (FE,B,S) -> Result
++ exprToUPS(fcn,posCheck?,atanFlag) converts the expression
++ \spad{fcn} to a power series. If \spad{posCheck?} is true,
++ log's of negative numbers are not allowed nor are nth roots of
++ negative numbers with n even. If \spad{posCheck?} is false,
++ these are allowed. \spad{atanFlag} determines how the case
++ \spad{atan(f(x))}, where \spad{f(x)} has a pole, will be treated.
++ The possible values of \spad{atanFlag} are \spad{"complex"},
++ \spad{"real: two sides"}, \spad{"real: left side"},
++ \spad{"real: right side"}, and \spad{"just do it"}.
++ If \spad{atanFlag} is \spad{"complex"}, then no series expansion
++ will be computed because, viewed as a function of a complex
++ variable, \spad{atan(f(x))} has an essential singularity.
++ Otherwise, the sign of the leading coefficient of the series
++ expansion of \spad{f(x)} determines the constant coefficient
++ in the series expansion of \spad{atan(f(x))}. If this sign cannot
++ be determined, a series expansion is computed only when
++ \spad{atanFlag} is \spad{"just do it"}. When the leading term
++ in the series expansion of \spad{f(x)} is of odd degree (or is a
++ rational degree with odd numerator), then the constant coefficient
++ in the series expansion of \spad{atan(f(x))} for values to the
++ left differs from that for values to the right. If \spad{atanFlag}
++ is \spad{"real: two sides"}, no series expansion will be computed.
++ If \spad{atanFlag} is \spad{"real: left side"} the constant
++ coefficient for values to the left will be used and if \spad{atanFlag}
++ \spad{"real: right side"} the constant coefficient for values to the
++ right will be used.
++ If there is a problem in converting the function to a power series,
++ a record containing the name of the function that caused the problem
++ and a brief description of the problem is returned.
++ When expanding the expression into a series it is assumed that
++ the series is centered at 0. For a series centered at a, the
++ user should perform the substitution \spad{x -> x + a} before calling
++ this function.

```

```

exprToGenUPS : (FE,B,S) -> Result
++ exprToGenUPS(fcn,posCheck?,atanFlag) converts the expression
++ \spad{fcn} to a generalized power series. If \spad{posCheck?}
++ is true, log's of negative numbers are not allowed nor are nth roots
++ of negative numbers with n even. If \spad{posCheck?} is false,
++ these are allowed. \spad{atanFlag} determines how the case
++ \spad{atan(f(x))}, where \spad{f(x)} has a pole, will be treated.
++ The possible values of \spad{atanFlag} are \spad{"complex"},
++ \spad{"real: two sides"}, \spad{"real: left side"},
++ \spad{"real: right side"}, and \spad{"just do it"}.
++ If \spad{atanFlag} is \spad{"complex"}, then no series expansion

```

```

++ will be computed because, viewed as a function of a complex
++ variable, \spad{atan(f(x))} has an essential singularity.
++ Otherwise, the sign of the leading coefficient of the series
++ expansion of \spad{f(x)} determines the constant coefficient
++ in the series expansion of \spad{atan(f(x))}. If this sign cannot
++ be determined, a series expansion is computed only when
++ \spad{atanFlag} is \spad{"just do it"}. When the leading term
++ in the series expansion of \spad{f(x)} is of odd degree (or is a
++ rational degree with odd numerator), then the constant coefficient
++ in the series expansion of \spad{atan(f(x))} for values to the
++ left differs from that for values to the right. If \spad{atanFlag}
++ is \spad{"real: two sides"}, no series expansion will be computed.
++ If \spad{atanFlag} is \spad{"real: left side"} the constant
++ coefficient for values to the left will be used and if \spad{atanFlag}
++ \spad{"real: right side"} the constant coefficient for values to the
++ right will be used.
++ If there is a problem in converting the function to a power
++ series, we return a record containing the name of the function
++ that caused the problem and a brief description of the problem.
++ When expanding the expression into a series it is assumed that
++ the series is centered at 0. For a series centered at a, the
++ user should perform the substitution \spad{x -> x + a} before calling
++ this function.

localAbs : FE -> FE
++ localAbs(fcn) = \spad{abs(fcn)} or \spad{sqrt(fcn**2)} depending
++ on whether or not FE has a function \spad{abs}. This should be
++ a local function, but the compiler won't allow it.
